ABSTRACT

Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (2019-nCoV), is a positive-sense, single-stranded RNA coronavirus. The virus is the causative agent of coronavirus disease 2019 (COVID-19) and is contagious through human-to-human transmission. The present study reports sequence analysis, complete coordinate tertiary structure prediction and *in silico* sequence-based and structure-basedfunctional characteration of full SARS-CoV-2 proteome based on the NCBI reference sequence NC_045512 (29903 bp ss-RNA) which is identical to GenBank entry MN908947 and MT415321. The proteome includes 12 major proteins namely orf1ab polyprotein (includes 15 proteins), surface glycoprotein, ORF3a protein, envelope protein, membrane glycoprotein, ORF6 protein, ORF7a protein, orf7b, ORF8, nucleocapsid phosphoprotein and ORF10 protein. Each protein of orf1ab polyprotein group has been studied separately. A total of 25 polypeptides have been analyzed out of which 15 proteins are not yet having experimental structures and only 10 are having experimental structures with known PDB IDs. Out of 15 newly predicted structures six (6) were predicted using comparative modeling and nine (09) proteins having no significant similarity with so far available PDB structures were modeled using as-initio modeling. The ERRAT and PROCHECK verification revealed that the all-atom model of tertiary structure of high quality and may be useful for structure-based drug designing targets. The study has identified nine major targets (spike protein, envelop protein, membrane protein, nucleocapsid protein, 2'-O-ribose methyltransferase, endoRNAse, 3'-to-5' exonuclease, RNA-dependent RNA polymerase and helicase) for which drug design targets can be considered. There are other 16 nonstructural proteins (NSPs), which can also be considered from the drug design perspective. The protein structures are deposited to ModelArchive.

Key words: Proteome analysis, orf1ab polyprotein, SARS-CoV-2, 2019-nCoV

INTRODUCTION

Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2), is a positive-sense, single-stranded RNA coronavirus, which is a major source of disaster in the 21th century. The virus is the causative agent of coronavirus disease 2019 (COVID-19) and is contagious through human-to-human transmission. Coronaviruses (CoVs) have a single-stranded RNA genome (size range between 26.2 and 31.7 kb, positive sense), covered by an enveloped structure (Yang *et al*., 2006). A typical CoV contains at least six ORFs in its genome. SARS-CoV-2 is the seventh coronavirus that is known to cause human disease. Coronaviruses (CoVs) are a group of large and enveloped viruses with positive-sense, single-stranded RNA genomes (Lai *et al*., 2007; Lu and Liu, 2012). Previously identified human CoVs that cause human disease include the alphaCoVs hCoV-NL63 and hCoV-229E and the betaCoVs HCoV-OC43, HKU1, severe acute respiratory syndrome CoV (SARS-CoV), and Middle East respiratory syndrome CoV

(MERS-CoV) (Lu *et al*., 2015). Among these seven strains, three strains proved to be highly pathogenic (SARS-CoV, MERS-CoV, and 2019-nCoV), which caused endemic of severe CoV disease(Paules *et al*., 2020).The viruses can be classified into four genera: alpha, beta, gamma, and deltaCoVs (Woo *et al*., 2009). Both alphaCoVs and the betaCoVs HCoV-OC43 and HKU1 cause self-limiting common cold-like illnesses (Chiu *et al*., 2005; Jean *et al*., 2013). However, SARS-CoV and MERS-CoV infection can result in life-threatening disease and have pandemic potential. SARS-CoV-2 is responsible for the infection with special reference to the involvement of the respiratory tract (both lower and upper respiratory tract), e.g., common cold, pneumonia, bronchiolitis, rhinitis, pharyngitis, sinusitis, and other system symptoms such as occasional watery and diarrhea (Chang *et al*., 2016; Paules *et al*., 2020).

The current classification of coronaviruses recognizes 39 species in 27 subgenera, five genera and two subfamilies that belong to the family *Coronaviridae*, suborder *Cornidovirineae*, order *Nidovirales* and realm *Riboviria* (Ziebuhr *et al*., 2017; Siddell *et al*., 2019; Ziebuhr et *al*., 2019) . The family classification and taxonomy are developed by the *Coronaviridae* Study Group (CSG), a working group of the ICTV (de Groot *et al*., 2012). To accommodate the wide spectrum of clinical presentations and outcomes of infections caused by SARS-CoV-2 (ranging from asymptomatic to severe or even fatal in some cases) (Huang *et al*., 2020), the WHO recently introduced a rather unspecific name (coronavirus disease 19, also known as COVID-19 (World Health Organization, 2020) to denote this disease. Whole-genome sequencing results showed that the causative agent was a novel coronavirus that was initially named 2019-nCoV by the World Health Organization (WHO) (Wu *et al*., 2020; Zhou *et al*., 2020; Zhu *et al*., 2020). Later, the International Committee on Taxonomy of Viruses (ICTV) officially designated the virus SARS-CoV-2 (Coronaviridae Study Group of the International Committee on Taxonomy of Viruses, 2020), although many virologists argue that HCoV-19 is more appropriate (Jiang *et al*., 2020).

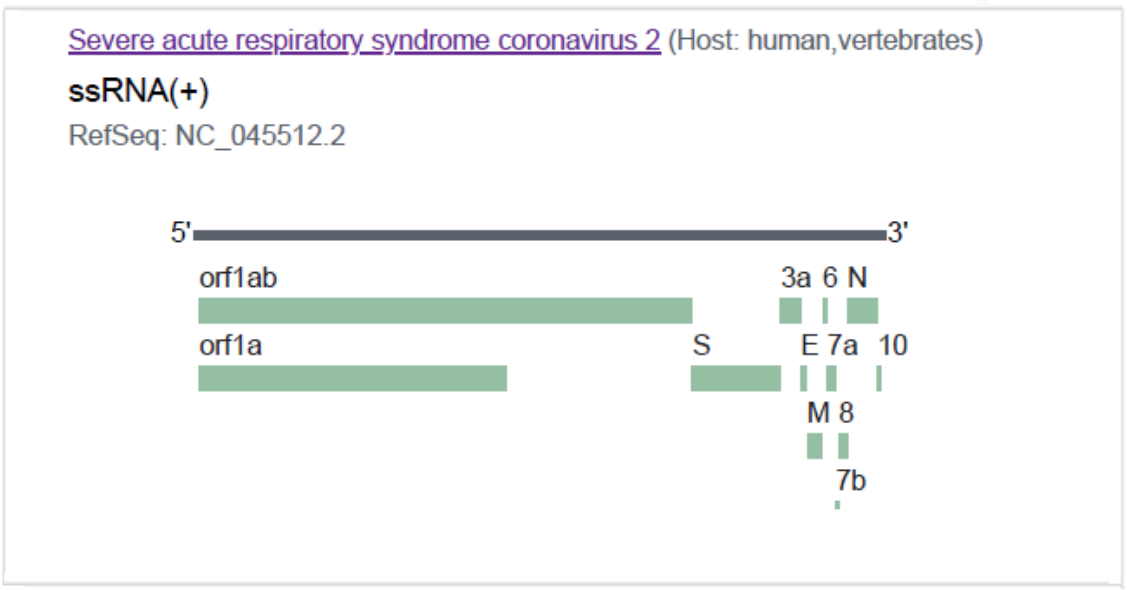

Figure 1. The structure of SARS-CoV-2 reference genome (NC_045512.2) used in the present study . The genome size is 29.9 Kb with GC% 38.0 and 11 genes which encodes 12 major proteins. SARS-CoV-2 has four structural proteins: the E and M proteins, which form the viral envelope; the N protein, which binds to the virus's RNA genome; and the S protein, which binds to human receptors. (Source: NCBI)

There is lack of specific drugs to treat an attack, which is an urgent need at this current point of time. Understanding the complete proteome of SARS-CoV-2 is the need of the hour. The major structural proteins namely

the E and M proteins, which form the viral envelope; the N protein, which binds to the virus's RNA genome; and the S protein, which binds to human receptors, may serve an important role from vaccine development or drug design perspectives. The nonstructural proteins get expressed as two long polypeptides, the longer of which gets chopped up by the virus's main protease. This group of proteins includes the main protease (Nsp5) and RNA polymerase (Nsp12) has equal importance for structure based drug designing. In this regard, the present study reports sequence analysis and structure prediction (both Comparative and *ab-initio* modeling) of full SARS-CoV-2 proteome based on the NCBI reference sequence NC_045512 (29903 bp ss-RNA) which is identical to GenBank entry MN908947 and MT415321 (Table 1).

The viral genome encodes 29 proteins (*Nature* DOI: 10.1038/s41433-020-0790-7). In the present analysis 25 proteins of NCBI reference sequence NC_045512 (Figure 1) (including 15 proteins of orf1ab) from the proteome have been analyzed out of which 15 proteins are not yet having experimental structures and 10 are having experimental structures with known PDB IDs. Out of 15 predicted structures six (6) proteins namely NSP6, Surface glycoprotein, Envelope protein, ORF7a, ORF8 and Nucleoproteins were predicted using comparative modeling and nine (09) proteins namely NSP1, NSP2, NSP3, NSP4, ORF3a, Membrane protein, ORF6, ORF7b and ORF10 having no significant similarity with so far available PDB structures were modeled using *ab-initio* modeling.

MATERIALS AND METHODS

Acquisition and analysis of sequences

The sequence of full SARS-CoV-2 proteome based on the NCBI reference sequence **NC_045512 (29903 bp ss-RNA)** along with GenBank entry MN908947 and **MT415321** were analyzed (**Table 1**). A total of 25 proteins from the proteome have been analyzed out of which 15 proteins are not yet having experimental structures based on BLASTp (Altschul *et al.*, 1997) and FASTA (Pearson, 1991) searches.

Three-dimensional structure prediction (Comparative and ab-initio modeling)

Out of the 25 polypeptide chains, ten (10) are having experimental structures with PDB IDs. Therefore, three dimensional structure predictions were carried out for fifteen (15) proteins for which complete 3D co-ordinate files are yet not available. BlastP and FASTA searches were performed independently with PDB to know the existing PDB structure, for obtaining a suitable template for Comparative modeling and to select the proteins for which *ab-initio* modeling is required (**Table 2**). The significance of the BLAST results was assessed by expect values (e-value) generated by BLAST family of search algorithm and query coverage. Six (6) proteins namely NSP6, Surface glycoprotein, Envelope protein, ORF7a, ORF8 and Nucleoproteins were predicted using comparative modeling using Modeller9.23 program (Webb and Sali, 2016) and Baker Rosetta Server (https://robetta.bakerlab.org/); nine (09) proteins namely NSP1, NSP2, NSP3, NSP4, ORF3a, Membrane protein, ORF6, ORF7b and ORF10 having no significant similarity with so far available PDB structures were modeled using *ab-initio* modeling using Baker Rosetta Server (https://robetta.bakerlab.org/). The loop regions were modeled using ModLoop server (Fiser and Sali, 2003). The final 3D structures with complete coordinates were obtained by optimization of a molecular probability density function (pdf) of Modeller (Eswar *et al.*, 2006). The molecular pdf for modelling was optimized with the variable target function procedure in Cartesian space that employed the method of conjugate gradients and molecular dynamics with simulated annealing (Sali and Blundell, 1993). The computational protein structures were verified by using Global and local (per-residue) quality estimates using ProQ3, ModFOLD6-TS, QMEANDisCo 4.0.0 (Haas *et al.*, 2019). After fruitful verification, the coordinate files were successfully deposited to

ModelArchive (https://www.modelarchive.org) All the graphic presentations of the 3D structures were prepared using Chimera version 1.8.1 (Pettersen *et al.*, 2004) .

Proteomics analysis

The proteomics analyses were carried out using ExPASy proteomic tools (https://www.expasy.org/tools). The Data mining, sequence analyses for physico-chemical parameters of SARS-CoV-2 proteomes were computed using ProtParam (Gasteiger *et al.*, 2005) and BioEdit. The important calculations for the amino acid composition, atomic composition, theoretical pI, molecular weight, Formula, extinction coefficients, half-life, instability index, aliphatic index, hydrophobicity, charge *vs.* pH were carried out under sequence analysis (**Table 3**).

The sequence based functional annotation have been carried out for SARS-CoV-2 proteome in the sequence database,using Pfam (*pfam.sanger.ac.uk/*-) , GO (www.geneontology.org/), KEGG database (www.genome.jp/kegg/). ProFunc server (Laskowski *et al.*, 2005) was used to identify the likely biochemical function of proteins from the predicted three-dimensional structure. Hmmer version 3.3 (Finn *et al.*, 2011), PFam, PROSITE, PRINTS, ProDom, InterProScan were used for functional characterization. MOLE 2.0 (Sehnal *et al.*, 2013) was used for advanced analysis of biomacromolecular channels.

RESULTS AND DISCUSSION

The ORF1ab polyprotein is the largest protein **(**7096 amino acids; 794.017kDa**)** out of SARS-CoV-2. It is rich in Leucine (9.41%) and Valine (8.43%.The protein has theoretical Isoelectric point (pI) 6.32, Instability index 33.31, Aliphatic index 86.87 and Grand average of hydropathicity - 0.070 (Figure 2a; Table 3). It is a multifunctional protein involved in the transcription and replication of viral RNAs. It contains the proteinases responsible for the cleavages of the polyprotein.

InterPro classification of protein families ORF1ab polyprotein belongs to Non-structural protein NSP1, betacoronavirus (IPR021590) protein family. The biologival process associated with ORF1ab protein includes-viral genome replication (*GO* :0019079), viral protein processing (*GO* :0019082), proteolysis (*GO* :0006508), transcription, DNA-templated (*GO* :0006351) and viral RNA genome replication (*GO* :0039694).

The molecular functions associated are zinc ion binding (*GO* :0008270), RNA binding (*GO* :0003723), omega peptidase activity (*GO* :0008242), cysteine-type endopeptidase activity (*GO* :0004197), transferase activity (*GO* :0016740), single-stranded RNA binding (*GO* :0003727), cysteine-type peptidase activity (*GO* :0008234), RNA-directed 5'-3' RNA polymerase activity (*GO* :0003968), ATP binding (*GO* :0005524) and nucleic acid binding (*GO* :0003676).

Hits for all PROSITE (release 2020_02) motifs on sequence of ORF1ab (YP_009724389-1) has detected 8 hits (Table 4)– (i)Peptidase family C16 domain profile : PS51124| PEPTIDASE_C16 (profile) Peptidase family C16 domain profile :1634 - 1898: score=60.973; (ii) Coronavirus main protease (M-pro) domain profile : PS51442|M_PRO (profile) Coronavirus main protease (M-pro) domain profile : 3264 - 3569: score=154.193; (iii) RdRp of positive ssRNA viruses catalytic domain profile : PS50507|RDRP_SSRNA_POS (profile) RdRp of positive ssRNA viruses catalytic domain profile : 5004 - 5166: score=8.290; (iv) Coronaviridae zinc-binding (CV ZBD) domain profile : PS51653| CV_ZBD (profile) Coronaviridae zinc-binding (CV ZBD) domain profile : 5325 - 5408: score=33.035; (v) (+)RNA virus helicase core domain profile : PS51657|PSRV_HELICASE (profile) (+)RNA virus helicase core domain profile : 5581 - 5932: score=27.299; (vi) Carbamoyl-phosphate synthase

subdomain signature 2 : PS00867|CPSASE_2 (pattern) Carbamoyl-phosphate synthase subdomain signature 2 : 2061 - 2068: [confidence level: (-1)]; vii) Lipocalin signature : PS00213| LIPOCALIN (pattern) Lipocalin signature : 4982 - 4993: [confidence level: (-1)] .

The ORF1a polyprotein (Length = 4405 amino acids;Molecular Weight = 489.963kDa) is also rich in Leucine (9.88%) and Valine (8.42%. ORF1a polyprotein has theoretical Isoelectric point (pI) 6.04, Instability index 34.92, Aliphatic index 88.87 and Grand average of hydropathicity - 0.023 (Figure 2B; Table 3).

InterPro classification of protein families ORF1a polyprotein belongs to Non-structural protein NSP1, betacoronavirus (IPR021590) family. It is involved in biological processes- viral genome replication (*GO: 0019079*), viral protein processing (*GO: 0019082*) and proteolysis (*GO* :0006508).

The molecular functions of ORF1a polyprotein are omega peptidase activity (*GO* :0008242), cysteine-type endopeptidase activity (*GO* :0004197), transferase activity (*GO* :0016740), RNA binding (*GO* :0003723), nucleic acid binding (*GO* :0003676), zinc ion binding (*GO* :0008270), cysteine-type peptidase activity (*GO* :0008234), RNA-directed 5'-3' RNA polymerase activity (*GO* :0003968), and single-stranded RNA binding (*GO* :0003727).

Hits for all PROSITE (release 2020_02) motifs on sequence of ORF1a (YP_009725295-1) has found 4 hits (Table 4)- (i) Macro domain profile :PS51154|MACRO (profile) Macro domain profile :1025 - 1194: score=18.014; (ii) Peptidase family C16 domain profile : PS51124|PEPTIDASE_C16 (profile) Peptidase family C16 domain profile :1634 - 1898: score=60.973; (iii) Coronavirus main protease (M-pro) domain profile : PS51442|M_PRO (profile) Coronavirus main protease (M-pro) domain profile : 3264 - 3569: score=154.193; (iv)Carbamoyl-phosphate synthase subdomain signature 2: >PS00867|CPSASE_2 (pattern) Carbamoyl-phosphate synthase subdomain signature 2 : 2061 - 2068: [confidence level: (-1)].

The ORF1ab polyprotein is protein complex of 15 proteins namely NSP1, NSP2, NSP3, NSP4, 3C-like proteinase, NSP6, NSP7, NSP8, NSP9, NSP10, RNA-dependent RNA polymerase, Helicase, 3'-to-5' exonuclease, EndoRNAse and 2'-O-ribose methyltransferase. Orf1ab polyprotein is a multifunctional protein involved in the transcription and replication of viral RNAs. Predicted functions of SARS-CoV-2 proteome with respective ProFunc score is listed in Table 4).

1. **Leader protein (NSP1)** (PF11501)

Non-structural protein NSP1 (IPR021590) is the N-terminal cleavage product from the viral replicase that mediates RNA replication and processing (Almeida *et al*., 2007). ProMotif results revealed that the structure of NSP1 protein has **2** sheets, 5 beta hairpins,4 beta bulges,7 strands,5 helices,1 helix-helix interacs,22 beta turns and 3 gamma turns (Figure 3 A). Physicochemical parameter analysis computed that NSP1 has theoretical Isoelectric point (pI) 5.36, Instability index 28.83, Aliphatic index 89.72 and Grand average of hydropathicity - 0.378 (Table 3).

NSP1 binds to the 40S ribosomal subunit and inhibits translation, and it also induces a template-dependent endonucleolytic cleavage of host mRNAs (Kamitani *et al*., 2009). Structurally, NSP1 consists of a mixed parallel/antiparallel 6-stranded beta barrel with an alpha helix covering one end of the barrel and another helix alongside the barrel (Almeida *et al*., 2007). NSP1 also suppresses the host innate immune functions by inhibiting type I interferon expression and host antiviral signaling pathways (Almeida *et al*., 2007).

2. Non-structural protein 2 (nsp2)

ProMotif results revealed that the structure of NSP2 has 2 sheets, 2 beta hairpins, 1 beta bulge, 4 strands;

23 helices; 15 helix-helix interacs; 40 beta turns; 10 gamma turns;1 disulphide (Figure 3B). NSP2 has theoretical Isoelectric point (pI) 6.25, Instability index 36.06, Aliphatic index 88.93 and Grand average of hydropathicity -0.062 (Table 3). This protein may play a role in the modulation of host cell survival signaling pathway by interacting with host PHB and PHB2.

3. Non-structural protein 3 (NSP3)

ProMotif results revealed that the structure of NSP3 has 6 sheets, 10 beta hairpins, 6 beta bulges, 23 strands, 139 helices, 130 helix-helix interacs,169 beta turns, 45 gamma turns, 6 disulphides (Figure 3C). NSP3 has theoretical Isoelectric point (pI) 5.56, Instability index 36.56, Aliphatic index 86.22 and Grand average of hydropathicity -0.175 (Table 3).

Biological Process of NSP3 is proteolysis (GO: 0006508) and it involes in molecular function such as single-stranded RNA binding (GO: 0003727), cysteine-type peptidase activity (GO: 0008234), RNA-directed 5'-3' RNA polymerase activity (GO: 0003968) and nucleic acid binding (GO: 0003676).

4. Non-structural protein 4 (NSP4)

ProMotif results revealed that the structure of NSP4 has 5 sheets, 6 beta hairpins, 3 beta bulges, 11 strands, 16 helices, 20 helix-helix interacs, 41 beta turns, 6 gamma turns (Figure 3D). NSP4 has theoretical Isoelectric point (pI) 7.16, Instability index 34.09, Aliphatic index 95.50 and Grand average of hydropathicity 0.343 (Table 3). NSP4 Participates in the assembly of virally-induced cytoplasmic double-membrane vesicles necessary for viral replication.This C-terminal domain (InterPro entry IPR032505) is predominantly alpha-helical, which may be involved in protein-protein interactions (Manolaridis *et al*., 2009)

5. 3C-like protein

ProMotif results revealed that the structure of 3C-like proteinase has 2 sheets, 7 beta hairpins, 7 beta bulges, 13 strands, 8 helices, 9 helix-helix interacs, 28 beta turns and 2 gamma turns. 3C-like proteinase has theoretical Isoelectric point (pI) 5.95, Instability index 27.65, Aliphatic index 82.12and Grand average of hydropathicity -0.019 (Table 3).

The biological process of 3C-like proteinase is the viral protein processing (*GO :*0019082). It resembles Peptidase_*C30* (PF05409) family which corresponds to Merops family C30. These peptidases are involved in viral polyprotein processing in replication.

6. Non-structural protein 6 (NSP6)

ProMotif results revealed that the structure of NSP6 has 1 sheet, 1 beta hairpin, 2 strands, 14 helices, 31 helix-helix interacs, 9 beta turns, 2 gamma turns (Figure 3E). NSP6 has theoretical Isoelectric point (pI) 9.11, Instability index 22.94, Aliphatic index 111.55 and Grand average of hydropathicity 0.790 (Table 3). Nsp6 may play a role in the initial induction of autophagosomes from host's endoplasmic reticulum.

It has been reported that NS6 can increase the cellular gene synthesis and it can also induce apoptosis through Jun N-terminal kinase and Caspase-3 mediated stress (Cheng *et al*., 2015). This protein can modulate host antiviral responses by inhibiting synthesis and signalling of interferon-beta (IFN-beta) via two complementary pathways. One involves NS6 interaction with host N-Myc (and STAT) interactor (Nmi) protein inducing its degradation via ubiquitin proteasome pathway, suppressing Nmi enhanced IFN signalling. The other pathway suppresses the translocation of signal transducer and activator of transcription 1 (STAT1) and downstream IFN signalling (Cheng *et al*., 2015)

7. Non-structural protein 7 (NSP7)

NSP7 is predominantly a alpha helical structure. ProMotif results revealed that the structure of NSP7 has 3 helices, 7 helix-helix interacs and 3 beta turns (PDB ID 7BV1_C). NSP7 has theoretical Isoelectric point (pI) 5.18, Instability index 51.97, Aliphatic index 117.35 and Grand average of hydropathicity 0.199 (Table 3). NSP7 may have the function in activating RNA-synthesizing activity and it forms a hexadecamer with nsp8 that may also participate in viral replication by acting as a primase. Molecular Function predicted by InterPro scan has predicted its molecular functions as omega peptidase activity (*GO :*0008242), cysteine-type endopeptidase activity (*GO :*0004197) and transferase activity (*GO :*0016740). NSP 7 belongs to nsp7 (PF08716). nsp7 (non structural protein 7) has been implicated in viral RNA replication.

8. **Non-structural protein 8 (**NSP8)

ProMotif results revealed that the structure of NSP8 has2 sheets, 2 beta hairpins, 1 beta bulge, 5 strands, 5 helices, 6 helix-helix interacs, 13 beta turns, 1 gamma turn (PDB ID 7BV1_B). NSP8 has theoretical Isoelectric point (pI) 6.58, Instability index 37.78, Aliphatic index 88.33 and Grand average of hydropathicity -0.192 (Table 3). It forms a hexadecamer with nsp7 that may participate in viral replication by acting as a primase. Molecular Functions of NSP8 are scanned as transferase activity (GO: 0016740), cysteine-type endopeptidase activity (*GO :*0004197) and omega peptidase activity (*GO :*0008242).

NSP alone as a monomer structure may not be biologically relevant as it forms a hexadecameric supercomplex with nsp7. The dimensions of the central channel and positive electrostatic properties of the cylinder imply that it confers processivity on RNA-dependent RNA polymerase (Zhai *et al*., 2005).

9. Non-structural protein 9 (NSP9)

ProMotif results revealed that the structure of Nsp9 has 2 sheets, 5 beta hairpins, 4 beta bulges, 7 strands
1 helix, 11 beta turns. NSP9 has theoretical Isoelectric point (pI) 9.10, Instability index 34.17, Aliphatic index 82.92 and Grand average of hydropathicity -0.227 (Table 3). May participate in viral replication by acting as a ssRNA-binding protein. NSP9 may have biological processes viral genome replication (GO: 0019079) and molecular function RNA binding (GO: 0003723). The NSP9 (PF08710) is a single-stranded RNA-binding viral protein likely to be involved in RNA synthesis (Egloff *et al*., 2004). Its structure comprises of a single beta barrel (Campanacci *et al*., 2003).

10. Non-structural protein 10 (NSP10)

ProMotif results revealed that the structure of NSP10 has 2 sheets, 1 beta hairpin, 5 strands, 6 helices, 3 helix-helix interacs, 13 beta turns, 1 gamma turn. NSP10 has theoretical Isoelectric point (pI) 6.29, Instability index 34.56, Aliphatic index 61.80 and Grand average of hydropathicity -0.068 (Table 3). It plays an essential role in viral mRNAs cap methylation.

The NSP 10 (PF09401) have biological process - viral genome replication (GO: 0019079) and Molecular function- RNA binding (GO: 0003723), zinc ion binding (GO: 0008270). A cluster of basic residues on the protein surface suggests a nucleic acid-binding function. Interacting selectively and non-covalently with an RNA molecule or a portion thereof. NSP10 contains two zinc binding motifs and forms two anti-parallel helices which are stacked against an irregular beta sheet (Joseph *et al.*, 2006). Nsp10 binds to nsp16 through an activation surface area in nsp10, and the resulting complex exhibits RNA cap (nucleoside-2'-O)-methyltransferase activity.

11. RNA-dependent RNA polymerase (Pol/RdRp)

ProMotif results revealed that the structure of RNA-dependent RNA polymerase has 8 sheets, 8 beta hairpins, 1 psi loop, 2 beta bulges, 22 strands, 41 helices, 58 helix-helix interacs, 91 beta turns and 16 gamma turns. It is associated with replication and transcription of the viral RNA genome. RNA-dependent RNA polymerase has theoretical Isoelectric point (pI) 6.14, Instability index 28.32, Aliphatic index 78.43 and Grand average of hydropathicity -0.224 (Table 3).

The biological process of Pol/RdRp (*Corona_RPol_N* _PF06478) is associated with transcription, DNA-templated (GO: 0006351), and viral RNA genome replication (*GO :*0039694). The molecular functions are predicted as RNA-directed 5'-3' RNA polymerase activity (*GO :*0003968), RNA binding (*GO :*0003723) and ATP binding (*GO :*0005524). Coronavirus RPol N-terminus family covers the N-terminal region of the coronavirus RNA-directed RNA polymerase. The nsp7 and nsp8 activate and confer processivity to the RNA-synthesizing activity of Pol (Kirchdoerfer and Ward, 2019).

12. Helicase

ProMotif results revealed that the structure of Helicase has 8 sheets, 1 beta alpha beta unit, 7 beta hairpins, 5 beta bulges, 26 strands, 19 helices, 16 helix-helix interacs, 92 beta turns, 15 gamma turns. Helicase has theoretical Isoelectric point (pI) 8.66, Instability index 33.31, Aliphatic index 84.49 and Grand average of hydropathicity -0.096 (Table 3).

Helicase protein has molecular functions- zinc ion binding (GO: 0008270) and ATP binding (GO: 0005524). Multi-functional protein Helicase is with a zinc-binding domain in N-terminus displaying RNA and DNA duplex-unwinding activities with 5' to 3' polarity. Activity of helicase is dependent on magnesium (By Similarity).

13. 3'-to-5' exonuclease

ProMotif results revealed that the structure of 3'-to-5' exonuclease has 6 sheets, 8 beta hairpins, 3 beta bulges, 23 strands, 13 helices, 10 helix-helix interacs, 60 beta turns. 3'-to-5' exonuclease has theoretical Isoelectric point (pI) 7.80, Instability index 28.85, Aliphatic index 78.96 and Grand average of hydropathicity -0.134 (Table 3). The two possible activities of 3'-to-5' exonuclease (NSP14) include exoribonuclease activity acting on both ssRNA and dsRNA in a 3' to 5' direction and a N7-guanine methyltransferase activity.

14. endoRNAse/ nsp15

ProMotif results revealed that the structure of endoRNAse (NSP15) has 7 sheets, 1 beta alpha beta unit, 9 beta hairpins, 6 beta bulges, 21 strands, 10 helices, 8 helix-helix interacs, 37 beta turns and 2 gamma turns. endoRNAse (NSP15) has theoretical Isoelectric point (pI) 5.06, Instability index 36.28, Aliphatic index 95.09 and Grand average of hydropathicity -0.076 (Table 3). endoRNAse is a Mn(2+)-dependent, uridylate-specific enzyme, which leaves 2'-3'-cyclic phosphates 5' to the cleaved bond.

15. 2'-O-ribose methyltransferase

ProMotif results revealed that the structure of 2'-O-ribose methyltransferase (NSP16) has 3 sheets, 3 beta alpha beta units, 1 beta hairpin, 2 beta bulges, 12 strands, 12 helices, 6 helix-helix interacs,15 beta turns and 4 gamma turns. 2'-O-ribose methyltransferase has theoretical Isoelectric point (pI) 7.59, Instability index 26.11, Aliphatic index 90.64 and Grand average of hydropathicity -0.086 (Table 3).

2'-O-ribose methyltransferase belongs to *NSP16* family (PF06460). The SARS-CoV RNA cap SAM-dependent (nucleoside-2'-O-)-methyltransferase (2'-O-MTase) is a heterodimer comprising SARS-CoV nsp10 and nsp16. Nsp16 adopts a typical fold of the S-adenosylmethionine-dependent methyltransferase (SAM) family as defined initially for the catechol O-MTase but it lacks several elements of the canonical MTase fold, such as helices B and C. The 2'-O-ribose methyltransferase (nsp16) topology matches those of dengue virus NS5 N-terminal domain and of vaccinia virus VP39 MTases (Chen *et al*., 2011).

16. Surface glycoprotein (spike glycoprotein)

ProMotif results revealed that the structure of Surface glycoprotein **(spike glycoprotein)**has 13 sheets, 18 beta hairpins, 18 beta bulges, 52 strands, 22 helices, 29 helix-helix interacs, 76 beta turns, 16 gamma turns and 12 disulphides (Figure 3F). Surface glycoprotein (Length = 1273 amino acids; Molecular Weight = 141.113kDa) is rich in Leucine (8.48%) and Serine (7.78) %). Surface glycoprotein has theoretical Isoelectric point (pI) 6.32, Instability index 32.86, Aliphatic index 84.67 and Grand average of hydropathicity -0.077 (Figure 2C; Table 3).

Surface glycoprotein involves in two important biological processes i.e. receptor-mediated virion attachment to host cell (GO: 0046813) and membrane fusion (GO: 0061025). **Spike protein S1** attaches the virion to the cell membrane by interacting with host receptor, initiating the infection. Binding to human ACE2 and CLEC4M/DC-SIGNR receptors and internalization of the virus into the endosomes of the host cell induces

conformational changes in the S glycoprotein. **Spike protein S2** mediates fusion of the virion and cellular membranes by acting as a class I viral fusion protein. **Spike protein S2'** Acts as a viral fusion peptide which is unmasked following S2 cleavage occurring upon virus endocytosis. It is a part of cellular components viral envelope (GO: 0019031) and integral component of membrane (GO: 0016021).

17. ORF3a protein

ProMotif results revealed that the structure of ORF3a protein (**Papain-lke protease**) has 7 sheets, 8 beta hairpins, 2 beta bulges, 15 strands, 6 helices, 3 helix-helix interacs, 28 beta turns, 2 gamma turns and 1 disulphide (Figure 3G). ORF3a protein (Molecular Weight = 31121.29 Daltons) is rich in Leucine (10.91%), Valine (9.09%), Threonine (8.73%) and Serine (8.00%). ORF3a protein has theoretical Isoelectric point (pI) 5.55, Instability index 32.96, Aliphatic index 103.42 and Grand average of hydropathicity 0.275 (Figure 2D; Table 3).

The protein belongs to family Protein 3a, betacoronavirus (IPR024407). Protein 3a encoded by Orf3/3a, also known as X1, which forms homotetrameric potassium, sodium or calcium sensitive ion channels (viroporin) and may modulate virus release. It has also been shown to up-regulate expression of fibrinogen subunits FGA, FGB and FGG in host lung epithelial cells (Shen *et al*., 2005; Lu *et al*., 2006).

3a protein is a pro-apoptosis-inducing protein. It localises to the endoplasmic reticulum (ER)-Golgi compartment. SARS-CoV causes apoptosis of infected cells through NLRP3 inflammasome activation, as ORF3a is a potent activator of the signals required for this activation, pro-IL-1beta gene transcription and protein maturation. This protein also promotes the ubiquitination of apoptosis-associated speck-like protein containing a caspase recruitment domain (ASC) mediated by its interaction with TNF receptor-associated factor 3 (TRAF3). The expression of ORF3a induces NF-kappa B activation and up-regulates fibrinogen secretion with the consequent high cytokine production (Yu *et al*., 2004; Lu *et al*., 2006).

Another apoptosis mechanism described for this protein is the activation of the PERK pathway of unfolded protein response (UPR), which causes phosphorylation of eIF2alpha and leads to reduced translation of cellular proteins as well as the activation of pro-apoptotic downstream effectors (i.e ATF4, CHOP) (Minakshi *et al*., 2009).

18. Envelope protein (E protein)

ProMotif results revealed that the structure of Envelope protein (E protein) has 4 helices, 2 helix-helix interacs and 3 beta turns (Figure 3H). Envelope protein (Molecular Weight = 8364.59 Daltons) is rich in Leucine (18.67%) and Valine (17.33%). Envelope protein has theoretical Isoelectric point (pI) 8.57, Instability index 38.68, Aliphatic index 144.00 and Grand average of hydropathicity 1.128 (Figure 2E; Table 3).

The Envelope protein Protein belongs to protein family Envelope small membrane protein, coronavirus (IPR003873) and Envelope small membrane protein, betacoronavirus (IPR043506). It plays a central role in virus morphogenesis and assembly. Biological Process of Envelope protein is pore formation by virus in membrane of host cell (GO: 0039707).

E proteins are well conserved among Coronavirus strains. They are small, integral membrane proteins involved in several aspects of the virus' life cycle, such as assembly, budding, envelope formation, and

pathogenesis (Schoeman and Fielding, 2019). E protein acts as a viroporin by oligomerizing after insertion in host membranes to create a hydrophilic pore that allows ion transport (Madan *et al*., 2005; Surya *et al*., 2015).

SARS-CoV E protein forms a Ca^{2+} permeable channel in the endoplasmic reticulum Golgi apparatus intermediate compartment (ERGIC)/Golgi membranes. The E protein ion channel activity alters Ca^{2+} homeostasis within cells boosting the activation of the NLRP3 inflammasome, which leads to the overproduction of IL-1beta. SARS-CoV overstimulates the NF-kappaB inflammatory pathway and interacts with the cellular protein syntenin, triggering p38 MARK activation. These signalling cascades result in exacerbated inflammation and immunopathology (Nieto-Torres *et al*., 2015).

19. Membrane glycoprotein (M protein)

ProMotif results revealed that the structure of Membrane glycoprotein 9 helices, 8 helix-helix interacs, 28 beta turns and 11 gamma turns (Figure 3I). Membrane glycoprotein (Molecular Weight = 25145.16 Daltons) Leucine (15.77%) and Isoleucine (9.01%). Membrane glycoprotein has theoretical Isoelectric point (pI) 9.51, Instability index 39.14, Aliphatic index 120.86 and Grand average of hydropathicity 0.446 (Figure 2F; Table 3).

Biological process of M protein is viral life cycle (GO: 0019058) ; includes attachment and entry of the virus particle, decoding of genome information, translation of viral mRNA by host ribosomes, genome replication, and assembly and release of viral particles containing the genome.

M protein is a component of the viral envelope that plays a central role in virus morphogenesis and assembly via its interactions with other viral proteins. Protein family membership of M protein includes FM matrix/glycoprotein, coronavirus (IPR002574). This family consists of various coronavirus matrix proteins which are transmembrane glycoproteins (Armstrong *et al*., 1984).

The membrane (M) protein is the most abundant structural protein and defines the shape of the viral envelope. It is also regarded as the central organiser of coronavirus assembly, interacting with all other major coronaviral structural proteins. M proteins play a critical role in protein-protein interactions (as well as protein-RNA interactions) since virus-like particle (VLP) formation in many CoVs requires only the M and envelope (E) proteins for efficient virion assembly (Ujike and Taguch, 2015).

Interaction of spike (S) with M is necessary for retention of S in the ER-Golgi intermediate compartment (ERGIC)/Golgi complex and its incorporation into new virions, but dispensable for the assembly process. Binding of M to nucleocapsid (N) proteins stabilises the nucleocapsid (N protein-RNA complex), as well as the internal core of virions, and, ultimately, promotes completion of viral assembly. Together, M and E protein make up the viral envelope and their interaction is sufficient for the production and release of virus-like particles (VLPs) (Schoeman and Fielding, 2019).

20. ORF6 protein

ProMotif results revealed that the structure of ORF6 protein has 3 helices, 1 helix-helix interact, 2 beta turns and 1 gamma turn (Figure 3 J). ORF6 protein (Molecular Weight = 7272.15 Daltons) is rich in Isoleucine (16.39%) and Leucine (13.11%). ORF6 protein has theoretical Isoelectric point (pI) 4.60, Instability index 31.16, Aliphatic index 130.98 and Grand average of hydropathicity 0.233 (Figure 2G; Table 3).

The ORF6 protein belongs to the protein family Non-structural protein NS6, betacoronavirus (IPR022736). Proteins in this family are typically between 42 to 63 amino acids in length, highly conserved among SARS-related coronaviruses (Geng *et al*., 2005).

21. ORF7a protein

Protein 7a (X4 like protein) is a non-structural protein which is dispensable for virus replication in cell culture. ProMotif results revealed that the structure of ORF7a protein has 1 sheet, 2 beta hairpins, 3 strands 5 helices, 4 helix-helix interacs, 8 beta turns, 1 gamma turn (Figure 3K).ORF7a protein (Molecular Weight = 13743.47 Daltons) is rich in Leucine (12.40%) Threonine (8.26 %) and Phenylalanine (8.26%). ORF7a protein has theoretical Isoelectric point (pI) 8.23, Instability index 48.66, Aliphatic index 100.74 and Grand average of hydropathicity 0.318 (Figure 2H; Table 3).

Protein 7a (SARS coronavirus X4 like protein) (Pfam: PF08779 SARS_X4) is a unique type I transmembrane protein (Nelson *et al*., 2005). It has been suggested that it has binding activity to integrin I domains (Hänel *et al*., 2006). It contains a motif which has been demonstrated to mediate COPII dependent transport out of the endoplasmic reticulum, and the protein is targeted to the Golgi apparatus (InterPro IPR01488) (Pekosz *et al*., 2006).

22. ORF 7b protein

ProMotif results revealed that the structure of ORF7b protein has 2 helices, 1 helix-helix interact,1 beta turn and 1 gamma turn (Figure 3L). ORF7b protein (Molecular Weight = 5179.98 Daltons) is rich in Leucine (25.58%) and Phenylealanine (13.95%). ORF7b protein has theoretical Isoelectric point (pI) 4.17, Instability index 50.96, Aliphatic index 156.51 and Grand average of hydropathicity 1.449 (Figure 2I; Table 3).

ORF7b has Protein family membership Non-structural protein 7b, SARS-like (IPR021532) (also known as accessory protein 7b, NS7B, ORF7b, and 7b) from human SARS coronavirus (SARS-CoV) and similar betacoronaviruses (Pekosz *et al*., 2006). It consists of an N-terminal, a C-terminal and a transmembrane domain, the latter is essential to retain the protein in the Golgi compartment (Schaecher *et al*., 2007, 2008). Despite it being named as "non-structural", it has been reported to be a structural component of SARS-CoV virions and an integral membrane protein (Schaecher *et al*., 2007).

23. ORF8 protein

ProMotif results revealed that the structure of ORF8 protein has 3 sheets, 1 beta bulge, 10 strands, 15 beta turns and 1 gamma turn (Figure 3M). ORF8 protein (Molecular Weight = 13830.33 Daltons) is rich in Valine (9.92%) Leucine (8.26%) and Isoleucine (8.26%). ORF8 protein has theoretical Isoelectric point (pI) 5.42, Instability index 45.79, Aliphatic index 97.36 and Grand average of hydropathicity 0.219 (Figure 2J; Table 3).

ORF8 protein belongs to the family Non-structural protein NS8, betacoronavirus (IPR022722).This family of proteins includes the accessory proteins encoded by the ORF8 in coronaviruses, also known as accessory protein 8, or non-structural protein 8 (NS8). *This is distinct from NSP8, which in encoded on the replicase*

*polyprotein. This protein has t*wo conserved sequence motifs: EDPCP and INCQ. It may modulate viral pathogenicity or replication in favour of human adaptation. ORF8 was suggested as one of the relevant genes in the study of human adaptation of the virus (Keng *et al*., 2006; Law *et al*., 2006).

24. Nucleocapsid phosphoprotein

ProMotif results revealed that the structure of Nucleocapsid phosphoprotein has 1 sheet, 1 beta hairpin, 2 strands, 30 helices, 27 helix-helix interacs, 31 beta turns, 11 gamma turns (Figure 3N). Nucleocapsid phosphoprotein (Molecular Weight = 45623.27 Daltons) is rich in Glycine (10.26%), Alanine (8.83%) and Serine (8.83%). Nucleocapsid phosphoprotein has theoretical Isoelectric point (pI) 10.07, Instability index 55.09, Aliphatic index 52.53 and Grand average of hydropathicity -0.971 (Figure 2K; Table 3).

The Nucleocapsid protein family SARS-COV-2 (IPR001218) is the member of protein family Nucleocapsid protein, coronavirus (IPR001218) and Nucleocapsid protein, betacoronavirus (IPR043505). Coronavirus (CoV) nucleocapsid (N) proteins have 3 highly conserved domains. The N-terminal domain (NTD) (N1b), the C-terminal domain (CTD) (N2b) and the N3 region. The N1b and N2b domains from SARS CoV, infectious bronchitis virus (IBV), human CoV 229E and mouse hepatic virus (MHV) display similar topological organisations. N proteins form dimers, which are asymmetrically arranged into octamers via their N2b domains. The protein is cellular component of viral nucleocapsid (GO: 0019013).

Domains N1b and N2b are linked by another domain N2a that contains an SR-rich region (rich in serine and arginine residues). A priming phosphorylation of specific serine residues by an as yet unknown kinase, triggers the subsequent phosphorylation by the host glycogen synthase kinase-3 (GSK-3) of several residues in the SR-rich region. This phosphorylation allows the N protein to associate with the RNA helicase DDX1 permitting template read-through, and enabling the transition from discontinuous transcription of subgenomic mRNAs (sgmRNAs) to continuous synthesis of longer sgmRNAs and genomic RNA (gRNA). Production of gRNA in the presence of N oligomers may promote the formation of ribonucleoprotein complexes, and the newly transcribed sgmRNA would guarantee sufficient synthesis of structural proteins (Wu et *al*., 2014; Cong *et al*., 2017, 2020).

It has been shown that N proteins interact with nonstructural protein 3 (NSP3) and thus are recruited to the replication-transcription complexes (RTCs). In MHV, the N1b and N2a domains mediate the binding to NSP3 in a gRNA-independent manner. At the RTCs, the N protein is required for the stimulation of gRNA replication and sgmRNA transcription. It remains unclear, however, how and why the N protein orchestrates viral RNA synthesis. The cytoplasmic N-terminal ubiquitin-like domain of NSP3 and the SR-rich region of the N2a domain of the N protein may be important for this interaction. The direct association of N protein with RTCs is a critical step for MHV infection (Cong *et al*., 2020). Sequence comparison of the N genes of five strains of the coronavirus mouse hepatitis virus suggests a three domain structure for the nucleocapsid protein (Parker and Masters, 1990).

25. ORF10 protein

ProMotif results revealed that the structure of ORF10 protein has 1 sheet , 1 beta alpha beta unit, 2 strands, 1 helix, 2 beta turns (Figure 3O).ORF10 protein (Molecular Weight = 4449.01 Daltons) is rich in Asperagine (13.16%), Leucine (10.53%), and Phenylalanine (10.53%). ORF10 protein has theoretical Isoelectric point (pI) 7.93, Instability index 16.06, Aliphatic index 107.63 and Grand average of hydropathicity 0.637 (Figure 2L; Table 3). Protein family membership has not been predicted for ORF 10 protein.

Hetero-Oligomeric Complexes

Nsp7-nsp8 hexadecamer may possibly confer processivity to the polymerase, maybe by binding to dsRNA or by producing primers utilized by the latter. Experimental evidence for SARS-CoV that nsp7 and nsp8 activate and confer processivity to the RNA-synthesizing activity of Polymerase (Subissi *et al*., 2014; Kirchdoerfer and Ward, 2019). Nsp10 plays a pivotal role in viral transcription by stimulating nsp14 3'-5' exoribonuclease activity. Nsp10 plays a pivotal role in viral transcription by stimulating nsp16 2'-O-ribose methyltransferase activity. Spike protein S1 binds to human ACE2, initiating the infection. CoV attaches to the target cells with the help of spike protein–host cell protein interaction (angiotensin converting enzyme-2 [ACE-2] interaction in SARS-CoV (Li *et al*., 2003) and dipeptidyl peptidase-4 [DPP-4] in MERS-CoV (Mubarak *et al*., 2019). After the receptor recognition, the virus genome with its nucleocapsid is released into the cytoplasm of the host cells. The viral genome contains ORF1a and ORF1b genes, which produce two PPs that are pp1a and pp1b (te Velthuis *et al*., 2016) which help to take command over host ribosomes for their own translation process(Stobart *et al*., 2013).

The Instability index value of SARS-COV-2 ranged between 16.06 (ORF10 protein) and 51.97 (NSP7), which classifies ORF10 protein as most stable and NSP7 as most unstable protein. The proteins namely ORF7a protein (48.66), ORF7b protein (50.96), NSP7 (51.97), ORF 8 protein (45.79) and Nucleocapsid phosphoprotein (55.09) are unstable as per the instability index. The rest of the proteins are showing stability as per the instability index (Table 3).Except Nucleocapsid phosphoprotein and ORF10 protein all other proteins of SARS-COV-2 are rich in Lucine (Figure 2).The aliphatic index of SARS-COV2 ranged between 61.80 (NSP10) and 156.51 (ORF 7b protein), which indicates most thermostability in ORF 7b protein (Table 3).The Grand average of hydropathicity (GRAVY) value of **NSP4 (**0.343), NSP6 (0.790), NSP7 (0.199), ORF3a protein (0.275), Envelpe protein (1.128), Membrane glycoprotein (0.446), ORF6 protein (0.233), ORF7a protein (0.318), ORF 7b protein (1.449), ORF 8 protein (0.219) and ORF10 protein (0.637) indicate that these proteins are hydrophobic in nature. The all other proteins are hydrophilic (Table 3).

The Tunnels, Clefts and pore analysis results for selected proteins of SARS-COV-2, calculated by MOLE 2.0 program version 2.5.13.11.08 and visualized using Pymol 0.97rc has been shown in Figures 4 and 5. The details of predicted structure verification report, Modelarchive structure download link doi (https://www.modelarchive.org/doi/10.xxxx/, structural analysis and interpretation for each protein will be provided (in Appendix-I).

CONCLUSION

The RNA genome of SARS-CoV-2 has 29.9 Kb nucleotides, encoding for 29 proteins, though one may not get expressed. Studying these different components of the virus, as well as how they interact with our cells is already yielding some clues, but much remains to be explored. The present study reported theoretical modeling of 15 proteins, In silico sequence-based and structure-based functional characteration of full SARS-CoV-2 proteome based on the NCBI reference sequence NC_045512 (29903 bp ss-RNA). The theoretical structures along with statistical verification reports deposited to ModelArchive will be available upon publication of this paper. The 15 theoretical structures will be useful for the scientific community for adavanced computational analysis on interections of each protein for detailed functional analysis of active sites towards structure based drug designing or to study potential vaccines towards preventing epidemics and pandemics in absence of complete experimental structure.

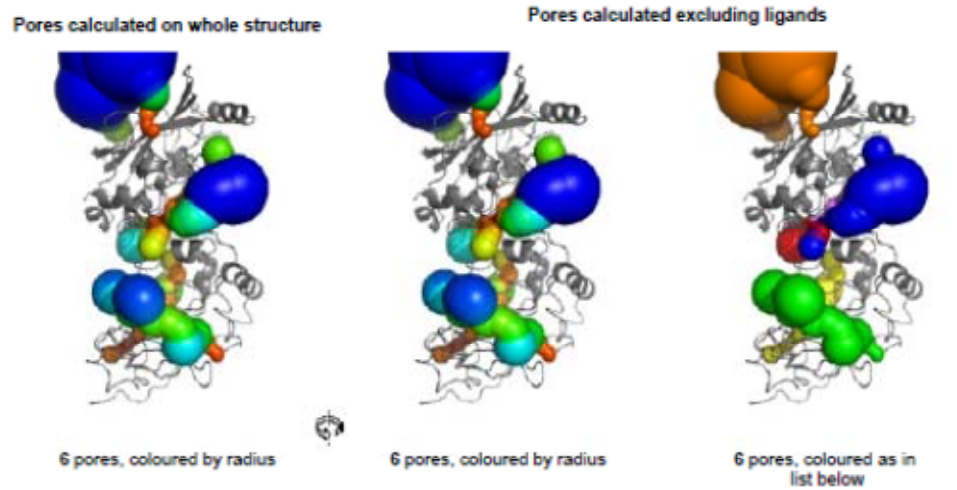
Protein structure

Residue-type_colouring

Positive	Negative	Neutral	Aliphatic	Aromatic	Pro & Gly
H,K,R	D,E	S,T,N,Q	A,V,L,I,M	F,Y,W	P,G

Figure 5 (A). Clefts for SARS-COV-2 membrane protein calculated by **MOLE 2.0 program** version 2.5.13.11.08 and visualized using **Pymol 0.97rc**.



Pores are connected internal spaces going through the structure. Only pores longer than 25 Å are shown.

Pores

	Radius	Free R	Length	HPathy	HPhob	Polar	Rel Mut	Residue_type						
1	1.38	1.38	26.0	-1.85	-0.49	20.9	72	6	2	0	1	1	3	0
2	1.40	2.53	36.0	-1.29	-0.37	21.2	86	4	2	2	3	1	0	0
