

Supplementary materials

Methods - Image acquisition

T1 and diffusion-weighted (DW) MRI data were acquired in Cheadle Manchester on a Siemens Skyra 3.0T scanner (Siemens Medical Solutions, Erlangen, Germany) with a 32-channel head coil (<https://www.healthcare.siemens.com/magnetic-resonance-imaging>). The following parameters were used for the T1-weighted sequence: field of view (FOV) = 208x256x256 mm; acquired voxel size = 1x1x1mm; repetition time (TR)/echo time (TE) = 2,000.00/2.01 ms; flip angle= 8°; plane acceleration iPAT = 2; acquisition time = 5.00 minutes. For the DW MRI data, the following parameters were used: FOV = 104x104x72mm; acquired voxel size = 2x2x2mm; TR/TE = 3,600/92ms; flip angle = 78°; acquisition time = 7.00 minutes. 72 slides, aligned to the anterior commissure to the posterior commissure and reversed, were collected along 50 gradient directions with $b=1,000$ s/mm 2 , $b=2,000$ s/mm 2 , and ten minimally diffusion ($b_0=0$ s/mm 2) weighted scans.

Methods - Neuroimaging data pre-processing and analysis

T1-weighted and DW volumes were pre-processed and analysed by UK Biobank (<https://ww5.aievolution.com/hbm1601/index.cfm?do=abs.viewAbs&abs=3664>)¹ using Functional Magnetic Resonance Imaging of the Brain (FMRIB) Software Library (FSL, <http://fsl.fmrib.ox.ac.uk/fsl>)². Pre-processing pipelines are documented on the UK Biobank website (UK Biobank, Brain Imaging Documentation V1.1, <http://www.ukbiobank.ac.uk>). Manual and automated quality control on the image data was performed prior to data release.

To ensure the anonymity of subjects, the T1-weighted volumes were ‘defaced’ (i.e., voxels in facial regions were set to zero). Thereafter, gradient distortion correction (GDC) was performed using a tool developed by teams of the Freesurfer and Human Connectome Project (HCP) (available at <https://github.com/Washington-University/Pipelines>).

Additionally, non-brain tissue was removed using BET (Brain Extraction Tool)³ and FLIRT (FMRIB's Linear Image Registration Tool)^{4,5}. Scans were nonlinearly aligned to Montreal Neurological Institute (MNI) 152 space, and segmented to identify WM, GM and cerebrospinal fluid (CSF) using FNIRT (FMRIB's Nonlinear Image Registration Tool)^{6,7}. Subsequently, total WM, GM, and CSF volume was calculated. Finally, FIRST (FMRIB's Integrated Registration and Segmentation Tool) was used to extract subcortical structures from the GM images⁸. Subcortical volumes were calculated for the following structures: caudate, hippocampus, pallidum, thalamus, amygdala, nucleus accumbens, and putamen bilaterally.

DW volumes were converted from DICOM into 4D Neuroimaging Informatics Technology Initiative (NIfTI) format, and b-vector and b-value files were created using Chris Rorden's dcm2niix conversion tool (<https://www.nitrc.org/plugins/mwiki/index.php/dcm2nii:MainPage>).

DW volumes were corrected for eddy current distortions (using the Eddy tool)^{6,7} and head motion, and outlier-slices were removed. Thereafter, GDC was performed using a similar method as used for the T1-weighted volumes. Mean diffusivity (MD) and FA maps were created by fitting the $b = 1,000 \text{ s/mm}^2$ shell into DTIFIT (DTI fitting tool). FA maps were warped to standard space, followed by a probabilistic tractography analysis. BEDPOSTx (Bayesian Estimation of Diffusion Parameters Obtained using Sampling Techniques) was used to model crossing fibers within each voxel⁹. Consequently, 27 WM tracts (12 bilateral and 3 unilateral WM tracts) were identified by starting at 27 different seed locations (defined by AutoPtx¹⁰), and fitting voxels that consecutively follow each other's direction using PROBTRACKx.

Tract-averaged water diffusion measures (FA and MD) were calculated for the following WM tracts: acoustic radiation, cingulum (cingulate gyrus and parahippocampal

part), corticospinal tract, forceps major (unilateral), forceps minor (unilateral), inferior fronto-occipital fasciculus, inferior longitudinal fasciculus, medial lemniscus, middle cerebral peduncle (unilateral), thalamic radiation (anterior, superior and posterior), and uncinate fasciculus. MD measures were calculated using the warping and tract defining parameters generated by FA maps. MD and FA are widely-used diffusion measures¹¹, which describe the directional coherence¹² and mean magnitude of water molecule diffusion independent from direction and tissue type¹³ respectively¹⁴.

Results - PGPS and total brain and subcortical volumes

FA: fractional anisotropy, MD: mean diffusivity, g: general factor, MDD: major depressive disorder, SCZ: schizophrenia,

BP: bipolar disorder, PGRS: polygenic risk scores, S.D.: standard deviation. Controlled for age, age² and gender,

genotype batch and array, and 15 MDS components. R²= estimate of variance explained by PGRS in %. # depicts

trendwise associations (p < 0.10).

Table S6. Association of PGRS (MDD, SCZ or BP) at other p thresholds with gFA and gMD for association, projection and thalamic WM fibers, in sample including outliers.

	Including outliers (N = 816)					Including outliers (N = 816)

MDD: major depressive disorder, SCZ: schizophrenia, BP: bipolar disorder, PGRS: polygenic risk scores, uncorr.: uncorrected, FDR: false discovery rate, S.D.: standard deviation.

Controlled for age, age², gender, genotype batch and array, 15 MDS components and side of hemisphere.

* Analyses performed separately for association of SCZ-PGRS with FA values of the cingulum (parahippocampal) for the analysis including outliers.

R² = estimate of variance explained by PGRS in %.

Table S8. Association of PGSR (MDD, SCZ or BP) at other p thresholds with FA, in sample including outliers.

	Including outliers (N = 816)

MD: mean diffusivity, WM: white matter, g: general factor, MDD: major depressive disorder, SCZ: schizophrenia, BP:

bipolar disorder, PGRS: polygenic risk scores. Controlled for age, age², gender, genotype batch and array, and 15 MDS components. R² = estimate of variance explained by PGRS in %. # depicts trendwise associations (p-FDR < 0.10).

Results - Age-related effects in structural brain measures

Table S11. Association between age and total grey matter, white matter and cerebrospinal fluid. in sample including and excluding outliers.

	Including outliers (N = 978)				Excluding outliers (N = 892)
