22
23 Running title: UBXN3B regulates hematopoiesis

26 **ABSTRACT**

27

28 Hematopoiesis is finely regulated to enable timely production of the right number and type of
29 mature immune cells to maintain tissue homeostasis. Dysregulated hematopoiesis may
30 compromise antiviral immunity and/or exacerbate immunopathogenesis. Herein, we report an
31 essential and new role of ubiquitin X domain containing gene 3B (UBXN3B) in balancing
32 myelopoiesis and lymphopoiesis. *Ubxn3b* deficiency (*Ubxn3b*^{-/-}) results in a remarkable
33 increase in myeloid cells and neutrophil-to-lymphocyte ratio, along with a reduction in
34 lymphocytes in steady-state mice. This dysregulation is exacerbated during viral infection and
35 renders mice highly vulnerable to severe lung pathology induced by severe acute respiratory
36 syndrome coronavirus 2 and arthritis by arthritogenic alphaviruses. *Ubxn3b*^{-/-} mice present
37 normal type I IFNs, higher viral loads and inflammatory mediators, lower virus-specific
38 immunoglobulin G and slower resolution of disease, when compared to *Ubxn3b*^{+/+} littermates.
39 Mechanistically, *Ubxn3b*^{-/-} mice have fewer multipotent progenitors and common lymphoid
40 progenitors, but more common myeloid progenitors. In particular, the precursor and immature B
41 cell numbers are dramatically decreased in the bone marrow of *Ubxn3b*^{-/-} mice. These data
42 demonstrate that UBXN3B signaling is essential for restricting viral infection and
43 immunopathogenesis by maintaining hematopoietic homeostasis.

44

45 Key word: hematopoiesis, UBXN, SARS-CoV-2, coronavirus, alphavirus, COVID-19.

46

47

48 INTRODUCTION

49
50 The immune system is comprised of various cell types that coordinate responses to infection by
51 maintaining tissue and immune homeostasis. Peripheral immune cells, with the exception of a
52 few cell types such as long-lived memory T cells and some tissue macrophages, are constantly
53 replenished from bone marrow stem cells through progenitor cells ¹. For instance, approximately
54 $0.5-1 \times 10^{11}$ granulocytes are generated daily in adult human individuals ². The hematopoietic
55 system is a hierarchically organized, somatic stem cell-maintained organ system, with long-lived
56 and self-renewing pluripotent hematopoietic stem cells (LT-HSCs) at its apex ¹. LT-HSCs
57 differentiate into short-term multipotent progenitors (MPPs or ST-HSCs) and lineage-committed
58 hematopoietic progenitors, which in turn will eventually differentiate into the numerous mature
59 blood cell lineages ³. While at the apex of the hematopoietic hierarchy, LT-HSCs are largely
60 quiescent, and the highly proliferative MPPs are the primary contributor to steady-state
61 hematopoiesis ^{4 5}. MPPs are capable of differentiating into lineage-committed progenitors, e.g.,
62 common lymphoid progenitors (CLPs) and common myeloid progenitors (CMP), which turn into
63 blast cells leading to specific cell types. These processes involve a global change of gene
64 expression controlled by cell-intrinsic transcription factors and epigenetic modifiers, and cell-
65 extrinsic factors such as cytokines, chemokines, growth factors, and interactions with
66 osteoblasts, endothelial cells, reticular cells and stromal cells in its bone marrow niche ³. The
67 HSC differentiation cascade must be finely regulated to enable timely production of the right
68 number and type of mature cells, i.e. homeostasis, disruption of which may lead to a
69 pathological state, such as autoimmunity, immunodeficiency, cancer etc. As example,
70 lymphopenia and a skewed myeloid-to-lymphoid ratio in the elderly may contribute to
71 inflammaging and impaired immunity ⁶.

72 The human genome encodes 13 ubiquitin regulatory X (UBX) domain-containing
73 proteins, designated UBXNs. The UBX domain shares weak homology with ubiquitin at the
74 protein level and adopts the same three dimensional fold as ubiquitin⁷. A number of UBXNs

75 have been shown to bind multiple E3 ubiquitin ligases and an ATPase associated with various
76 cellular activities (AAA ATPase), p97^{8,9}. We and other research groups have recently shown
77 that several UBXNs regulate viral RNA-sensing RIG-I (retinoic acid inducible gene 1) like
78 receptor -mitochondrial antiviral viral signaling (RLR-MAVS)¹⁰⁻¹² and Nuclear factor- κ B (NF- κ B)
79 signaling pathways^{13,14}. Of note, we recently reported that UBXN3B controlled DNA virus
80 infection by positively regulating the dsDNA-sensing cGAS (cyclic di-GMP-AMP synthase)-
81 STING (stimulator-of-interferon-genes) signaling and innate immunity¹⁵. However, the
82 physiological function of UBXN3B in RNA virus infection remains unknown. To this end, we
83 studied two positive-sense single-stranded RNA [(+) ssRNA] viruses of great public health
84 significance, severe acute respiratory syndrome (COVID-19)-causing coronavirus 2 (SARS-
85 CoV-2), and a mosquito-borne arthritogenic alphavirus, Chikungunya virus (CHIKV). Since its
86 emergence in humans in China late 2019, SARS-CoV-2 has infected more than 112 million and
87 killed over 2.5 million people worldwide (Source: World Health Organization,
88 <https://covid19.who.int>), constituting the greatest global public health crisis in the 21st century.
89 CHIKV is the causative agent of acute and chronic crippling arthralgia. The most recent CHIKV
90 epidemic in the Americas has resulted in over 3 million infection cases in more than 40
91 countries (Source: Pan America Health Organization, www.paho.org). Although from very
92 different families, both SARS-CoV-2 and CHIKV can elicit inflammatory responses and massive
93 infiltration of immune cells into their target organs. CHIKV elicits self-perpetuating inflammation
94 characterized by potent infiltration of macrophages, monocytes, neutrophils etc. into muscles
95 and joints^{16 17}. SARS-CoV-2 induces life-threatening lung immunopathology, typified by
96 elevated levels of inflammatory mediators, myeloid immune infiltrates in the lung, neutrophilia
97 and lymphopenia¹⁸. Herein, we found that UBXN3B is essential for maintaining hematopoietic
98 homeostasis. *Ubxn3b* deficiency (*Ubxn3b*^{-/-}) results in a systemic change in the steady-state
99 immune cell composition, with a remarkable increase in myeloid cells, neutrophil-to-lymphocyte
100 ratio (N/L), and a dramatic reduction in lymphocytes. This dysregulation is exacerbated during

101 viral infection and renders mice highly susceptible to severe lung pathology induced by SARS-
102 CoV-2 and arthritis by arthritogenic alphaviruses. Mechanistically, UB3B is essential for
103 maintaining MPPs and CLP homeostasis, precursor B cell differentiation and proliferation.

104

105 RESULTS

106

107 UB3B controls pathogenesis of respiratory viral diseases

108 Using a tamoxifen-inducible Cre-LoxP system, we recently successfully deleted global UB3B
109 protein expression in adult mice and demonstrated that UB3B positively regulated the
110 STING-mediated innate immune response to a DNA virus¹⁵. To understand the physiological
111 function of UB3B in restricting pathogenesis of RNA viral diseases, we first tested respiratory
112 viruses of public health significance including SARS-CoV-2. Because immunocompetent adult
113 mice are minimally permissive to clinical isolates of SARS-CoV-2, we delivered human
114 angiotensin-converting enzyme 2 (ACE2, the cellular entry receptor for SARS-CoV)-expressing
115 Ad5 vector (replication-defective adenovirus vector) intranasally to the mouse lung before
116 infection^{19 20}. We observed a slight drop in body mass a few days post SARS-CoV-2 infection
117 (p.i.) and rapid recovery of *Ubx3b*^{+/+} (Cre⁺ *Ubx3b*^{flox/flox}) mice, while there was a ~10%
118 reduction in body weight in *Ubx3b*^{-/-} (Cre⁺ *Ubx3b*^{flox/flox} treated with tamoxifen) littermates by
119 days 3-4 p.i. and a significant delay in recovery (**Fig.1a**). Moreover, all infected *Ubx3b*^{-/-} mice
120 showed hunched posture and decreased mobility on day 2 after infection, which was absent
121 from *Ubx3b*^{+/+} animals (Supplemental Movie 1 and 2). Histopathological analyses by
122 hematoxylin and eosin (H&E) staining revealed immune cell infiltrates in the lung of both
123 *Ubx3b*^{+/+} and *Ubx3b*^{-/-} mice on day 3 p.i., compared to uninfected mice (Day 0). However,
124 there was no significant difference in the numbers of immune infiltrates between the two
125 genotypes (**Fig.1b**). On day 10 p.i. many clusters of brownish cells were noted in all *Ubx3b*^{-/-},
126 but none in any *Ubx3b*^{+/+} mice (**Fig.1b**). We reasoned that these brownish cells in H&E

127 staining were representative of hemosiderosis, a form of iron overload disorder resulting in the
128 accumulation of hemosiderin, an iron-storage complex. In the lung, macrophages phagocytose
129 red blood cells due to vascular leakage, leading to iron overload. Using iron staining we tested
130 this hypothesis and detected a few lightly iron-laden cells on day 3 p.i., but many clusters of
131 heavily iron-laden cells by day 10 p.i. in all the *Ubxn3b*^{-/-} lungs compared to *Ubxn3b*^{+/+} (**Fig.1c,**
132 **d**). On day 35 p.i., we still noted moderate lung hemosiderosis in some knockout mice. These
133 data suggest an essential role of UBXM3B in restricting SARS-CoV-2 pathogenesis in the lung.
134 We next asked if these observations could be extended to other respiratory viruses, such as
135 influenza. Indeed, *Ubxn3b*^{-/-} mice lost more body weight; and of note 70% of them succumbed
136 to a dose of H1N1 influenza A that was sublethal to *Ubxn3b*^{+/+} mice (**Fig.1e, f**).

137 Severe COVID-19 pathogenesis is a combination of a direct cytopathic effect of SARS-
138 CoV-2 replication and hyper-inflammation in the lung¹⁸. In particular, COVID-19 fatality is
139 strongly associated with elevated inflammatory mediators (interleukin 6 IL-6, tumor necrosis
140 factor TNF- α etc.)¹⁸. We first examined viral loads and immune gene expression. The viral
141 loads in the lungs were higher in *Ubxn3b*^{-/-} when compared to *Ubxn3b*^{+/+} mice on day 3 p.i, and
142 by day 10 p.i. virus was almost cleared (**Fig.2a**). The serum cytokines IL-6, TNF- α , IL-10 and
143 GM-CSF were higher in *Ubxn3b*^{-/-} than in *Ubxn3b*^{+/+} on day 3 p.i. (**Fig.2b**), which is consistent
144 with clinical observations in severe COVID-19 patients. The concentrations of serum IFN- α ,
145 CXCL10 and IFN- γ were modestly upregulated, but equally in both *Ubxn3b*^{-/-} and *Ubxn3b*^{+/+}
146 mice after SARS-CoV-2 infection, suggesting a normal type I/II IFN response (**Fig.2b**).

147 COVID-19 fatality is strongly associated with an imbalance in immune cell
148 compartmentalization, characterized by neutrophilia and lymphopenia^{21 22 23 24 25 26}. We analyzed
149 neutrophils and T cells in the lung by flow cytometry and found that the total CD45⁺ immune cell
150 counts per lung were ~10-fold higher in SARS-CoV-2-infected animals than mock-treated
151 animals. However, there was no significant difference between *Ubxn3b*^{-/-} and *Ubxn3b*^{+/+}
152 littermates (**Fig.3a**). Upon close examination we detected ~3 -fold increase in *Ubxn3b*^{-/-}

153 compared to *Ubxn3b*^{+/+} mice in the frequency of CD11b⁺ cells, while total and CD4⁺ T cells were
154 reduced in *Ubxn3b*^{-/-} (**Fig.3b**). Importantly, the ratio of neutrophil-to-T lymphocytes (N/L) in the
155 lung was significantly higher (3.2-fold) in *Ubxn3b*^{-/-} (**Fig.3c**), which is consistent with clinical
156 observations in severe COVID-19 patients²⁷. This prompted us to examine more immune cell
157 populations in the lung and peripheral blood, and the longer impact of SARS-CoV-2 infection on
158 immune cells. We noted ~3-fold increase in neutrophil and 10-fold decrease in B cell
159 frequencies (**Fig.3d**, Supplemental **Fig.1**); the N/L ratio was also much higher in the blood of
160 *Ubxn3b*^{-/-} than *Ubxn3b*^{+/+} mice on day 3 p.i. (**Fig.3e**). By day 35 p.i., lower total immune cells
161 per lung in *Ubxn3b*^{-/-} than *Ubxn3b*^{+/+} mice were observed, however, more myeloid cells such as
162 neutrophils and macrophages/monocytes, a higher N/L ratio, but fewer B and T lymphoid cells
163 in *Ubxn3b*^{-/-} (**Fig.3f, g**). Of note, the B cell frequency were most dramatically decreased (5-20-
164 fold) in both the lung and blood (**Fig.3f, g**). Consistently, there were ~40% fewer total CD45⁺
165 cells in the blood (**Fig.3h**) and lymphocytes in the marginal zone of the white pulp marked by
166 greater myeloid infiltrates in the red pulp in the spleen of *Ubxn3b*^{-/-} than in *Ubxn3b*^{+/+} on day 35
167 p.i. (Supplemental **Fig.2**).

168

169 **UBXN3B controls pathogenesis of alphaviral arthritis**

170 The aforementioned results demonstrate a profound change in the immune cell
171 compartmentalization in *Ubxn3b*^{-/-} during SARS-CoV-2 infection, characterized by much greater
172 myeloid and fewer lymphoid cells. We then asked if this phenotype could be extended to other
173 viral diseases in the absence of *Ubxn3b*. Although from very different families, both SARS-CoV-
174 2 and CHIKV, an arthritogenic alphavirus, can elicit inflammatory cytokines and massive
175 infiltration of immune cells into their target organs. CHIKV was directly injected into one footpad
176 to induce swelling and acute arthritis in mice. *Cre*⁺ *Ubxn3b*^{flox/flox} (*Ubxn3b*^{+/+}) and tamoxifen-
177 treated *Cre*⁻ *Ubxn3b*^{flox/flox} (wild-type) mice showed progressive footpad swelling, which peaked
178 on day 6 p.i. and receded rapidly. In contrast, tamoxifen-treated *Cre*⁺ *Ubxn3b*^{flox/flox} (*Ubxn3b*^{-/-})

179 mice presented more severe and persistent foot swelling (**Fig.4a, b**). Histopathological analyses
180 by H&E staining confirmed increased immune cell infiltration into the muscles and joints of
181 *Ubxn3b*^{-/-} compared to *Ubxn3*^{+/+} littermates on day 16 p.i. (**Fig.4c, d**). Similar results were
182 observed for another arthritogenic alphavirus, O'nyong nyong (ONNV) (Supplemental **Fig.3**).
183 Moreover, the CHIKV viremia on days 2 and 4 p.i., and viral loads in footpads on days 4 and 8
184 p.i. were significantly higher in *Ubxn3b*^{-/-} than *Ubxn3*^{+/+} mice (Supplemental **Fig.4**). Next the
185 concentrations of serum immune mediators by multiplex ELISA were assessed, and higher
186 levels of IL-6, CXCL10, TNF- α and IFN- γ with different kinetics were observed in *Ubxn3b*^{-/-} over
187 *Ubxn3b*^{+/+} mice, in particular, even after viremia had been cleared on day 8 p.i (Supplemental
188 **Fig.5**). We detected more neutrophils and macrophages/monocytes, but fewer B and T cells in
189 CHIKV-targeted tissues, e.g. the footpad, blood and spleen of *Ubxn3b*^{-/-} than *Ubxn3b*^{+/+} mice
190 (**Fig.4e**). Of note, the N/L ratios were much higher in all the tissue of *Ubxn3b*^{-/-} mice (**Fig.4fe**).
191 These data suggest that UBXM3B signaling is essential for not only clearing CHIKV rapidly but
192 also restraining immunopathology post viral clearance.

193 Because B/T lymphocyte counts were significantly reduced in *Ubxn3b*^{-/-}, we asked if this
194 deficiency influenced production of virus-specific antibodies. Indeed, the concentrations of
195 serum anti-CHIKV/ONNV/influenza immunoglobulin G (IgG) were ~50% lower in *Ubxn3b*^{-/-} than
196 in *Ubxn3b*^{+/+} mice (Supplemental **Fig.6**).

197

198 **UBXM3B regulates steady-state hematopoietic homeostasis**

199 These results suggest an essential role of UBXM3B in maintenance of immune cell homeostasis
200 during viral infection regardless of viral species. Therefore, to test the hypothesis that
201 dysregulated immune homeostasis is caused by *Ubxn3b*^{-/-} deficiency, we reasoned that in the
202 steady state *Ubxn3b*^{-/-} mice should have alterations that cannot be explained by infection.
203 Indeed, by flow cytometry, we observed a significant increase in the frequencies of myeloid cells
204 (neutrophils, monocytes, macrophages), in the blood and spleen of *Ubxn3b*^{-/-} compared to

205 *Ubxn3b*^{+/+} mice. Although the T cell frequencies were slightly lower, its counts were significantly
206 lower in both tissues of *Ubxn3b*^{-/-} (**Fig.5a, b**). The total CD45⁺ count per spleen was ~3-fold
207 lower in *Ubxn3b*^{-/-} (**Fig.5b**). Of note, *Ubxn3b*^{-/-} mice had over 10 times lower B cell counts and
208 frequencies in both tissues of knockout mice (**Fig.5a, b**). Although the magnitudes of difference
209 in each immune cell frequency and count varied with tissues, the N/L ratios were uniformly
210 much higher in all tissues of *Ubxn3b*^{-/-} when compared to *Ubxn3b*^{+/+} mice (**Fig.5a, b**).

211 These results suggested that UBXM3B regulates hematopoietic homeostasis. To this
212 end, we first quantitated mature immune cells in the bone marrow. Among all live cells (after
213 lysis of red blood cells), neutrophils were most abundant, then B cells. Consistent with
214 observations in the peripheral immune organs, the frequency of neutrophils was significantly
215 greater, while the number of B cells was ~6-fold lower in *Ubxn3b*^{-/-} than in *Ubxn3b*^{+/+} mice
216 (**Fig.6a, b**). These results suggest that elevated N/L ratios in *Ubxn3b*^{-/-} is due to dysregulated
217 hematopoiesis, which we tested by assessing bone marrow stem cells and progenitors. Total
218 HSCs (Lin⁻ Sca⁺ Kit⁺) contains two populations, long-term HSCs, which are capable of self-
219 renewal but are quiescent at steady state, and short-term multipotent HSCs (also known as
220 MPPs), which are capable of differentiating into lineage-committed progenitors. We noted that
221 there were fewer total HSCs in *Ubxn3b*^{-/-} when compared to *Ubxn3b*^{+/+}; this was because of a
222 decrease in MPPs, but not LT-HSCs, which were the same (**Fig.6c, d**). The frequency of
223 lineage-committed common lymphoid progenitors (CLPs) was also reduced, while the common
224 myeloid progenitors (CMPs) trended higher in *Ubxn3b*^{-/-}. Remarkably, the B cell precursors
225 (Pre-B) and immature B cells were significantly lower in *Ubxn3b*^{-/-} (**Fig.6c, d**).

226

227 DISCUSSION

228

229 UBXM3B might participate in diverse cellular activities, ranging from lipid metabolism^{28,29,30,28,31}
230³²⁻³⁵, protein degradation^{36,37}, mRNA stability³⁸, protein translocation³⁹ to regulation of innate

231 immunity¹⁵. In this study, we discovered a novel physiological function of UBXN3B in
232 hematopoietic hemostasis with subsequent control of immunopathogenesis during viral infection.
233 These multifaceted functions of UBXN3B are likely attributable to its capability as an adaptor to
234 interface different E3 ligases and substrates¹⁰ under different physiological conditions and
235 developmental stages. The involvement of an adaptor in an E3 ligase action could greatly
236 expand the substrate spectrum of the E3 ligase in response to various physiological and
237 environmental cues. Our conclusion is substantiated by several pieces of evidence. First,
238 *Ubxn3b*^{-/-} mice presented worse lung damage during SARS-CoV-2 infection and arthritis elicited
239 by arthritogenic alphaviruses than *Ubxn3b*^{+/+} mice. Second, *Ubxn3b*^{-/-} mice had higher viral
240 loads and inflammatory mediators such as IL-6 and TNF- α . Third, lymphocytes, in particular the
241 B cell numbers were significantly lower, while neutrophils and monocytes/macrophages were
242 greater in various *Ubxn3b*^{-/-} organs during the steady state and viral infection. Fourth,
243 production of the virus-specific IgG was impaired in *Ubxn3b*^{-/-} mice. Mechanistically, UBXN3B
244 might control RNA virus infection by regulating STING^{15 40}. However, steady-state
245 hematopoiesis was normal in *Sting*-deficient mice⁴¹, suggesting that the primary function of
246 UBXN3B during RNA virus infection is independent of STING. Furthermore, expression of type I
247 IFNs was normal in *Ubxn3b*^{-/-} mice. These data suggest that dysregulated hematopoiesis may
248 be the main contributor to failure of viral clearance and prolonged immunopathology in
249 *Ubxn3b*^{-/-} mice. Indeed, the fine balance between lymphopoiesis and myelopoiesis was
250 interrupted, characterized by more CMPs and neutrophils, and fewer CLPs and B cells in the
251 *Ubxn3b*^{-/-} bone marrow. In particular, proliferation of precursor B cells was significantly inhibited
252 in the *Ubxn3b*^{-/-} bone marrow, suggesting that UBXN3B play an important role in transition of
253 progenitor B to precursor B cells.

254 Although belonging to very different families of RNA viruses, both arthritogenic
255 alphaviruses and SARS-CoV-2 elicit immunopathology in their target tissues, including massive
256 immune infiltrates and elevated levels of systemic pro-inflammatory mediators^{16 17 18}. In

257 particular, COVID-19 fatality is strongly associated with neutrophilia and lymphopenia ¹⁸, which
258 was partly recapitulated in *Ubxn3b*^{-/-} mice. These animals were typified by neutrophilia and
259 lymphopenia during steady state and viral infection, were highly prone to vascular damage by
260 SARS-CoV-2 in the lung, and were slow to recover from infection. Similarly, viral clearance and
261 resolution of arthritis elicited by alphaviruses was significantly delayed in *Ubxn3b*^{-/-} mice. This
262 was not due to type I IFNs, which were normal in *Ubxn3b*^{-/-} mice; rather likely because of a
263 reduction in B/T cell numbers and consequently virus-specific antibody production. Indeed, T
264 lymphopenia is associated with shortened survival independently of and /or additive to
265 traditional risk factors, especially when accompanied by heightened inflammation in general
266 adults ⁴². Primary B-cell immunodeficiency may lead to a defective production of antigen-
267 specific antibodies and predisposition to recurrent and severe infections ⁴³ and frequently
268 autoimmune diseases ⁴⁴. On the other hand, heightened immunopathology and tissue damage
269 persisted in *Ubxn3b*^{-/-} mice even after viral clearance (day 16 post CHIKV, day 10 post SARS-
270 CoV-2 inoculation), suggesting that UBKN3B controls immunopathogenesis disassociated from
271 viral replication. Indeed, chronic CHIKV arthritis pathogenesis can progress without active viral
272 replication ⁴⁵. The hyperinflammation phase of COVID-19 generally happens after viral load
273 peak, with a few infectious viral particles ⁴⁶. At the post viral clearance stage, a high N/L ratio
274 may underlie sustained inflammation. Indeed, high N/L ratios are correlated with poor prognosis
275 of severe COVID-19 patients ^{47 27}. The N/L ratio is also the most reliable biomarkers associated
276 with numerous chronic inflammatory diseases, such as type II diabetes ⁴⁸, cardiovascular
277 disease ⁴⁹, aging ⁵⁰ etc., which are significant risk factors for COVID-19 mortality ¹⁸. These
278 conditions are characterized by a low-grade pro-inflammatory and an “immunosenescence”-like
279 immune state that is unable to clear viruses ²⁷. In this regard, UBKN3B deficiency might
280 resemble the aging immune state, which is prone to viral infection and chronic inflammatory
281 conditions. The protective role of UBKN3B in these disease conditions in mice may be
282 potentially applicable to those in humans considering that the UBKN3B protein is highly

283 conserved in mammals (98% identity between human and rodent protein). Importantly, an
284 rs374702773 (delta T allele in intron) in UB3N3B is associated with protection against alcoholic
285 liver cirrhosis, a chronic inflammatory condition in humans⁵¹.

286 In summary, our results suggest that a high N/L ratio predisposes an individual to
287 persistently heightened immunopathology during viral infection that can lead to damaging organ
288 inflammation. Immediate future work will pinpoint the molecular mechanism of UB3N3B action
289 in immune progenitors and function of UB3N3B in auto-inflammatory diseases.

290 MATERIALS AND METHODS

291

292 *Mouse model*

293 The mouse line with the exon 1 of *Ubxn3b* flanked by two LoxP sites (*Ubxn3b*^{flox/flox}) were
294 generated via homologous recombination by Dr. Fujimoto at Nagoya University³². The
295 homozygous *Ubxn3b*^{flox/flox} were then crossed with homozygous tamoxifen-inducible Cre
296 recombinase-estrogen receptor T2 mice (The Jackson Laboratory, Stock # 008463) to generate
297 Cre⁺ *Ubxn3b*^{flox/flox} littermates. To induce *Ubxn3b* deletion, > 6-weeks old mice were injected
298 with 100 μ l of tamoxifen (10 mg /ml in corn oil) (Sigma, #T5648) via intraperitoneal (i.p.)
299 every 2 days for a total duration of 8 days (4 doses). Successful deletion of *Ubxn3b* was
300 confirmed in our recent study¹². A half of Cre⁺ *Ubxn3b*^{flox/flox} litters were treated with tamoxifen
301 and designated *Ubxn3b*^{-/-}; the other half were treated with corn oil only and designated
302 *Ubxn3b*^{+/+}. Mice were allowed to purge tamoxifen for at least 4 weeks before any infection or
303 analyses was performed. The animal protocols were approved by the Institutional Animal Care
304 and Use Committee at the University of Connecticut and Yale University.

305

306 *Antibodies, Cell lines and Viruses*

307 Human embryonic kidney 293 cells transformed with T antigen of SV40 (HEK293T, #
308 CRL-3216) and Vero cells (monkey kidney epithelial cells, # CCL-81) were purchased from
309 American Type Culture Collection (ATCC) (Manassas, VA20110, USA). These cell lines are not
310 listed in the database of commonly misidentified cell lines maintained by ICLAC. Cells were
311 grown in DMEM supplemented with 10% fetal bovine serum (FBS) and antibiotics/antimycotics
312 (Life Technologies, Grand Island, NY 14072 USA). We routinely added MycoZAP (Lonza Group,
313 Basel, Switzerland) to cell cultures prevent mycoplasma contamination.

314 SARS-CoV-2 (NR-52281, Isolate USA-WA1/2020) was provided by BEI Resources
315 (funded by National Institute of Allergy and Infectious Diseases and managed by ATCC, United

316 States). The CHIKV French La Reunion strain LR2006-OPY1 was a kind gift of the Connecticut
317 Agricultural Experiment Station at New Haven, CT, USA. The CHIKV vaccine strain 181, clone
318 25 was recovered from a plasmid and used for enzyme-Linked Immunosorbent assay (ELISA)⁵²
319 ⁵³. The ONNV UgMP30 strain (NR-51661) was provided by BEI Resources. All these viruses
320 were propagated in Vero cells. The full-length human ACE2 [Accession No: NM_021804.2]
321 cDNA was inserted into pAV-EGFP-CMV/FLAG and Ad5 viruses were prepared by Vector
322 Builder Inc. (Chicago, IL 60609, USA).

323

324 *Concentration of SARS-CoV-2*

325 The virus was grown in Vero cells for 72hrs, and the culture medium was cleared by brief
326 centrifugation. A PEG-it Virus Precipitation Solution (Cat# LV810A-1, System Biosciences, Palo
327 Alto, CA 94303, USA) was added to 40ml of virus culture at a 1:4 ratio, incubated overnight at
328 4°C. The mixture was centrifuged at 1500xg for 30 min, and the resulting pellet was suspended
329 in 1ml of DMEM medium. In parallel, Vero cell culture medium without virus was processed in
330 the same way and used for mock infection.

331

332 *Plaque-Forming Assay*

333 Quantification of infectious viral particles in sera or homogenized tissues was performed on
334 Vero cell monolayer⁵⁴. Briefly, viral samples were incubated with confluent Vero cells (6-well
335 plate) at 37°C for 2 hr. The inoculum was then removed and replaced with 2 ml of DMEM
336 complete medium with 1% SeaPlaque agarose (Cat.# 50100, Lonza). The cells were incubated
337 at 37°C, 5% CO₂ for 3 days, and on the fourth day the cells were stained with Neutral Red
338 (Sigma-Aldrich) overnight.

339

340 *Mouse Infection and Monitoring*

341 Mice were administered intranasally 2×10^8 plaque forming units (PFU) of Ad5-hACE2, after 5
342 days then intranasally inoculated with 2×10^5 PFU of SARS-CoV-2 or mock. The body mass of
343 individual mice was weighed on the day of infection (Day 0) as a baseline. The percentage
344 change in an animal was calculated as $100 \times (\text{Day } n - \text{Day } 0) / \text{Day } 0$, where n defines the length
345 of infection (in days).

346 About 3×10^5 plaque-forming units (PFU) of CHIKV LR2006-OPY1 or ONNV was
347 inoculated at the ventral side of a hind foot subcutaneously. The thickness and width of the
348 perimetatarsal area of the hind foot were measured using a precision metric caliper. The foot
349 dimension was calculated as $\text{width} \times \text{thickness}$, and the results were expressed as fold
350 increase in the foot dimension after infection compared to before infection (day 0 baseline).

351

352 *Tissue Histology*

353 Tissues were fixed in 4% paraformaldehyde (PFA), embedded in paraffin, cut into $4 \mu\text{M}$ - thick
354 sections, immobilized to glass slides, decalcified, and processed for hematoxylin and eosin
355 staining. Arbitrary arthritic disease scores (on a 1–5 scale with 1 being the slightest, 5 the worst)
356 were assessed using a combination of histological parameters, including exudation of fibrin and
357 inflammatory cells into the joints, alteration in the thickness of tendons or ligament sheaths, and
358 hypertrophy and hyperlexia of the synovium²¹ in a double-blinded manner.

359 Hemosiderosis was evaluated by iron staining (Prussian Blue stain) (Cat. # ab150674,
360 from Abcam, Cambridge, CB2 0AX, UK). Lungs were fixed in 4% PFA, embedded in paraffin,
361 cut into $4 \mu\text{M}$ - thick sections, immobilized to glass slides, deparaffinized in xylene, rinsed with
362 100% ethanol, hydrated progressively in 95%, 70% ethanol and distilled water. The slides were
363 incubated in Iron Stain Solution (1:1 of potassium ferrocyanide solution to hydrochloric acid
364 solution) for 3 min at ambient temperature, rinsed thoroughly in distilled water, stained in
365 Nuclear Fast Red Solution for 5 minutes, rinsed again with distilled water 4 times, dehydrated in
366 95% alcohol followed by absolute alcohol, and finally mounted in synthetic resin. The slides

367 were assessed with an Accu-Scope microscope EXI-310 and images were acquired by an
368 Infinity II camera and software.

369

370 *Reverse Transcription and Quantitative (q) PCR*

371 Up to 1×10^6 cells or 10mg, tissues were collected in 350 μ l of RLT buffer (QIAGEN RNeasy
372 Mini Kit). RNA was extracted following the QIAGEN RNeasy manufacturer's instructions.
373 Reverse transcription of RNA into complementary DNA (cDNA) was performed using the BIO-
374 RAD iScript™ cDNA Synthesis Kit. Quantitative PCR (qPCR) was performed with gene-specific
375 primers and SYBR Green PCR master mix. Results were calculated using the $-\Delta\Delta C_t$ method
376 and a housekeeping gene, beta actin, as an internal control. The qPCR primers and probes for
377 immune genes were reported in our previous studies^{15, 40,55}. The primers for SARS-CoV-2 were
378 forward: 5'-GAC CCC AAA ATC AGC GAA AT-3' and reverse: 5'-TCT GGT TAC TGC CAG
379 TTG AAT CTG-3', CHIKV forward: 5' -GCGAATTCGGCGCAGCACCAAGGACAACCTTCA-3'
380 and reverse 5' -AATGCGGCCGCTAGCAGCATATTAGGCTAAGCAGG-3' , ONNV forward
381 primer: 5' -GCAGGGAGGCCAGGACAGT-3' and reverse 5' -
382 GCCCCTTTTTCYTTGAGCCAGTA-3' .

383

384 *Fluorescence-Activated Cell Sorting (FACS)*

385 FACS was performed according to our published study¹⁷. Mouse tissues were minced with a
386 fine scissor and digested in 4 mL of digestion medium [20 mg/mL collagenase IV (Sigma-Aldrich,
387 St. Louis, MO, USA), 5 U/mL dispase (Stemcell, Cambridge, MA, USA), and 50 mg/mL DNase I
388 mix (Qiagen, Germantown, MD, USA) in complete RPMI1640 medium] at 37 °C for 4 hrs. The
389 lysate was filtrated with a 40 μ m cell strainer. Cells were then pelleted down by centrifugation at
390 500 \times g for 5 min. The red blood cells in the cell pellet were lysed three times with a lysis buffer
391 (Cat. # 420301 from BioLegend, San Diego, CA 92121, USA). Cells were suspended in FACS

392 buffer and stained for 30 min at 4 °C with the desired antibody cocktails (Biolegend, San Diego,
393 CA, US) of APC-Fire 750-anti CD11b (Cat. # 101261, clone M1/70), Alexa Fluor 700-anti Ly-6G
394 (Cat. # 127621, clone 1A8), Brilliant Violet 421-anti CD11c (Cat. # 117343, clone N418), PerCP-
395 Cy5.5-anti MHC II (Cat. # 107625, clone M5/114.15.2), PE-anti Tetherin (PCDA1) (Cat. # 12703,
396 clone 10C2), Brilliant Violet 510-anti F4/80 (Cat. # 123135, clone BM8), APC-anti CD68 (Cat. #
397 137007, clone FA-11), PE-Dazzle 594-anti CD3 epsilon (Cat. # 100347, clone 145-2C11),
398 Brilliant Violet 711-anti CD4 (Cat. # 100557, clone RM4-5), Brilliant Violet 570-anti CD8a (Cat. #
399 100739, clone 53-6.7), Brilliant Violet 650 anti-CD161 (NK1.1) (Cat. # 108735, clone PK136),
400 FITC anti-CD117 (cKit) (Cat. # 105805, clone 2B8), PE anti- erythroid cells (Cat. # 116207,
401 clone TER-119), Brilliant Violet 711-anti CD115 (Cat. # 135515, clone AFS98), FITC-anti CD25
402 (Cat. # 102005, clone PC61), Zombie UV (Cat. # 423107), PE-Cy7-anti CD45 (Cat. # 103113,
403 clone 30-F11), TruStain FcX-anti CD16/32 (Cat. # 101319, clone 93), APC anti-CD127 (IL-7Ra)
404 (Cat. # 135011, clone A7R34), PE-Dazzle 594 anti-Sca-1 (Ly-6A/6E) (Cat. # 108137, clone D7),
405 PE-Cy5 anti-Flt-3 (CD135) (Cat. # 135311, clone A2F10), Brilliant Violet 421-anti CD34 (Cat. #
406 119321, clone MEC14.7), PE anti-CD16/32 (Cat. # 101307, clone 93), Brilliant Violet 711-anti
407 IgM (Cat. # 406539, clone RMM-1), Brilliant Violet 421-anti CD45R (B220) (Cat. # 103239,
408 clone RA3-6B2), Alexa Fluor 700-anti CD19 (Cat. # 115527, clone 6D5), PE-Cy7 anti-CD93
409 (Cat. # 136505, clone AA4.1) and Lin- (anti-CD4, CD8, CD11b, Cd11c, Gr1, NK1.1, TER119,
410 Singlec-F, FcεRIa, CD19, B220 cocktail). After staining and washing, the cells were fixed with 4%
411 PFA and analyzed on a Becton-Dickinson FACS ARIA II, CyAn advanced digital processor
412 (ADP). Data were analyzed using the FlowJo software. Among CD45⁺ cells, CD11b⁺ Ly6G⁺ cells
413 were classified as neutrophils, Ly6G⁻CD11b⁺ F4/80⁺ as monocytes/macrophages, Ly6G⁻ CD11b⁺
414 CD115⁺ as monocytes, Ly6G⁻ CD11c⁺ MHC II⁺ as dendritic cells (DC), CD3⁺ as total T cells,
415 CD3⁺ CD4⁺ as CD4 T cells, CD3⁺ CD8⁺ as CD8 T cells, CD19⁺ as B cells. Lin⁻ Sca⁺ Kit⁺ cells
416 were identified as total HSCs, which were subdivided into Flt3^{high} (short-term HSC or MPP) and
417 Flt3^{low} (long-term HSC). Lin⁻ Sca⁻ Kit⁺ cells were subdivided into CD34^{low} CD16/32^{low} (MEP),

418 CD34^{high} CD16/32^{low} (CMP) and CD34^{low} CD16/32^{high} (GMP). The Lin⁻ CD127⁺ Kit⁺ cells were
419 identified as CLP.

420

421 *Multiplex Enzyme-Linked ImmunoSorbent Assay (ELISA)*

422 We used a LEGENDPlex (Biolegend, San Diego, CA 92121, USA) bead-based immunoassay to
423 quantify the cytokine concentrations in the cell culture supernatant of SARS-CoV-2 infected
424 cells. The procedures were exactly the same as in the product manual. Briefly, the supernatants
425 or standards were mixed with antibody-coated microbeads in a filter-bottom microplate, and
426 incubated at room temperature for 2hrs with vigorous shaking at 500 rpm. After removal of
427 unbound analytes and two washes, 25 μ L of detection antibodies were added to each well, and
428 the plate was incubated at room temperature for 1hr with vigorous shaking at 500 rpm. 25 μ L of
429 SA-PE reagent was then added directly to each well, and the plate was incubated at room
430 temperature for 30min with vigorous shaking at 500 rpm. The beads were washed twice with
431 wash buffer, and then transferred to a microfuge tube. The beads were fixed with 4% PFA for
432 15min and resuspended in the assay buffer. The beads were run through a BIORAD ZE5 and
433 the concentrations of analytes were calculated with the standards included using the
434 LEGENDPlex software.

435

436 *Quantification of IgG by Enzyme-Linked ImmunoSorbent Assay (ELISA)*

437 One nanogram of recombinant SARS-CoV-2 Spike protein, $\sim 1 \times 10^6$ viral particles in coating
438 buffer (0.05 M carbonate-bicarbonate, pH 9.6), or recombinant A/PR/8/34 influenza NP
439 (generated by UConn Health Protein Expression Core) was coated to a 96-well microplate at
440 4°C overnight. The plate was washed once with wash solution (50 mM Tris, 0.14 M NaCl, 0.05%
441 Tween 20, pH 8.0), and blocked with 4% bovine serum albumin at room temperature for 2hrs.
442 100 μ L of each diluted serum (500-fold) was added a well and incubated at room temperature for
443 1hr, then washed three times. 100 μ L of diluted horseradish peroxidase-conjugated goat anti-

444 mouse IgG was added to each well and incubated at room temperature for 1hr. After stringency
445 wash, 100 μ L of substrate 3,3',5,5' - tetramethylbenzidine (TMB) was added to each well and
446 incubated at room temperature for 5-30min for color development, and terminated by 100 μ L of
447 0.16M sulfuric acid. The absorption at wavelength 450nm (A_{450nm}) was read on a Cytation 1
448 plate reader (BioTek, Winooski, VT, USA).

449

450 *Data Acquisition and Statistical Analysis*

451 The sample size chosen for our animal experiments in this study was estimated according to
452 our prior experience in similar sets of experiments and power analysis calculations
453 (http://isogenic.info/html/power_analysis.html). All animal results were included and no method
454 of randomization was applied. All data were analyzed with a GraphPad Prism software by non-
455 parametric Mann-Whitney test or two-tailed Student's *t*-test depending on the data distribution.
456 The survival curves were analyzed by Log-Rank test. P values of ≤ 0.05 were considered
457 statistically significant.

458

459 **Footnotes**

460

461 Author contribution: T.G designed and performed the majority of the experimental procedures
462 and data analyses. D.Y., T.L., A.G.H. and L.Y. contributed to some of the experimental
463 procedures and/or provided technical support. B.W. contributed to some FACS analyses. B.T.
464 and L.H. helped to acquire the influenza data. G.C., A.T.V. and E.F. helped with data
465 interpretations. P.W. conceived and oversaw the study. T.G. and P.W. wrote the paper and all
466 the authors reviewed and/or modified the manuscript.

467

468 Funding Source: This project was funded in part by National Institutes of Health grants to P. W,
469 R01AI132526 and R21AI155820.

470

471 Conflict of Interest: No financial or non-financial interest to disclose.

621 **FIGURE LEGEND**

622

623

624 **Fig.1 UBXN3B is essential for controlling SARS-CoV-2 and influenza pathogenesis. a-d)**

625 Sex-and-age matched mice were administered 2×10^5 plaque forming units (PFU) of SARS-CoV-

626 2 intranasally. **a)** Percentage changes in the body mass of mock-treated Cre⁺ Ubxn3b^{fl^{ox}/fl^{ox}}

627 (designated *Ubxn3b*^{+/+}) and tamoxifen (TMX) -treated Cre⁺ Ubxn3b^{fl^{ox}/fl^{ox}} (designated *Ubxn3b*^{-/-})

628 littermates, during the course of SARS-CoV-2 infection. Data point: mean \pm s.e.m, N=6-8. *,

629 $p < 0.05$; **, $p < 0.01$; ***, $p < 0.001$ (two-tailed Student's *t*-test). **b)** Representative micrographs of

630 hematoxylin and eosin staining (H&E) of lung sections from mock or SARS-CoV-2 infected mice

631 on day 3 and 10 post infection (p.i.). The green arrow points to a cluster of immune infiltrates.

632 The red arrow indicates a cluster of brownish cells of hemosiderosis. Magnification 400 x. **c)**

633 Iron-staining (blue) of lung sections from mock or SARS-CoV-2 infected mice on days 3 and 10

634 p.i. Black arrows point to iron laden cells. Mock: mock infected. N=2 (mock), 4 (Day 3), 7 (Day

635 10), 3 (Day 35) per genotype. **e, f)** Sex-and-age matched mice were administered 350 CCID₅₀

636 (cell culture infectious dose 50% assay) influenza A PR/8/34 H1N1 intranasally. **e)** The

637 percentage of the body mass relative to day 0 (weighed immediately before infection). Data

638 point: mean \pm s.e.m. N= 5-6. **f)** The survival curve. N=6 per genotype. P=0.02 (Log-Rank test).

639

640 **Fig.2 UBXN3B is essential for controlling SARS-CoV-2 pathogenesis.** Sex-and-age

641 matched mice were administered 2×10^5 plaque forming units (PFU) of SARS-CoV-2 intranasally.

642 **a)** Quantitative RT-PCR (qPCR) quantification of SARS-CoV-2 loads in the lung on days 3 and

643 10 post infection (p.i.). Data point: mean \pm s.e.m, N=8 per group for day 3 and 6 for day 10. **b)**

644 Quantification of serum immune mediators by multiplex ELISA during the course of SARS-CoV-

645 2 infection. Each symbol= one mouse, the small horizontal line: the median of the result. *,

646 $P < 0.05$; **, $P < 0.01$ (non-parametric Mann-Whitney test) between *Ubxn3b*^{+/+} and *Ubxn3b*^{-/-}
647 littermates at the same time point.

648

649 **Fig.3 UBXN3B is essential for immune cell homeostasis during SARS-CoV-2 infection.**

650 Sex-and-age matched mice were administered 2×10^5 plaque forming units (PFU) of SARS-CoV-
651 2 intranasally. **a)** The total CD45⁺ cells, **b)** the percentage (relative to CD45⁺ cells) of various
652 immune cell populations quantified by FACS, **c)** the neutrophil-to-T cell ratio, in one lung of
653 SARS-CoV-2 infected mice on day 3 post infection (p.i.). **d)** The percentage (relative to CD45⁺
654 cells) of various immune cell populations, and **e)** the neutrophil-to-B/T cell ratios (N/B, N/T), in
655 the blood on day 3 post infection (p.i.). The cell counts and percentage of various immune cell
656 populations **f)** and **g)** the neutrophil-to-B/T cell ratios in one lung, **h)** cell counts in the blood on
657 day 35 p.i. Neu: neutrophil, Mac/Mono: macrophage/monocyte, DC: dendritic cell. Each
658 symbol=one mouse. *, $p < 0.05$; **, $p < 0.01$; ***, $p < 0.001$ (non-parametric Mann-Whitney test).
659 The horizontal line indicates the median of the result.

660

661 **Fig.4 UBXN3B is essential for restricting pathogenesis of CHIKV arthritis.** Sex-and-age

662 matched littermates were administered 1×10^5 plaque forming units (PFU) of CHIKV
663 subcutaneously in one footpad. **a)** Representative images of foot swelling (n=3 animals). The
664 red arrows indicate the foot inoculated with CHIKV. **b)** Fold changes in the footpad dimensions
665 of infected mice over uninfected (day 0). Data point: mean \pm s.e.m (n=3 mice per genotype).
666 **c)** Representative micrographs of hematoxylin and eosin staining of ankle joints on day 16 post
667 CHIKV infection (p.i.) [N=10 *Ubxn3b*^{+/+}, 5 *Ubxn3b*^{-/-} animals]. B: bone, T: tendon, M: muscle.
668 Magnification: 200 x. **d)** The arbitrary scores of ankle joint inflammation and damage using
669 scales of 1 to 5, with 5 representing the worst disease presentation. **e)** The percentage (relative
670 to CD45⁺ cells) of various immune cell populations quantified by FACS, and **f)** the neutrophil to
671 B/T cell ratios, in the CHIKV-inoculated footpad, the spleen and blood circulation on day 7 post

672 infection (p.i.). Neu: neutrophil, Mac/Mono: macrophage/monocyte, DC: dendritic cell. Each
673 symbol=one mouse. The horizontal line indicates the median of the result. *, $p<0.05$; **, $p<0.01$;
674 ***, $p<0.001$ (two-tailed Student's t-test for panel **b**, **d**; non-parametric Mann-Whitney test for
675 panel **e**, **f**).

676

677 **Fig.5 UBXN3B is essential for steady-state immune cell homeostasis.** The percentage
678 (relative to CD45⁺ cells) of various immune cell populations, cell counts, and the neutrophil to
679 B/T cell ratios, were quantified by FACS in the **a**) blood and **b**) spleen of specific pathogen-free
680 mice. Neu: neutrophil, Mac/Mono: macrophage/monocyte, DC: dendritic cell, Mast: mast cell,
681 Eos: eosinophil, NK: natural killer, NKT: natural killer T cells. Each symbol=one mouse. The
682 horizontal line indicates the median of the result. *, $p<0.05$; **, $p<0.01$; ***, $p<0.001$ (two-tailed
683 Student's t-test).

684

685 **Fig.6 UBXN3B is essential for hematopoietic hemostasis.** The **a**) gating strategy and **b**)
686 frequencies (relative to live cells after lysis of red blood cells) of various mature immune cells,
687 the **c**) gating plan and **d**) frequencies of stem cells/progenitors, in the bone marrows of specific
688 pathogen-free mice. BM: bone marrow, Neu: neutrophil, Mono: monocyte, DC: dendritic cell, NK:
689 natural killer, LSK: Lin⁻ Sca⁺ Kit⁺, LT-HSC: long-term hematopoietic stem cell, ST-HSC: short-
690 term multipotent HSC (also known as MPP), CMP: common myeloid progenitor, CLP: common
691 lymphoid progenitor, GMP: granulocyte-macrophage progenitor, MEP: megakaryocyte-
692 erythroid progenitor, ProB: progenitor B, PreB: precursor B, ImmB: immature B. Each
693 symbol=one mouse. The horizontal line indicates the median of the result. *, $p<0.05$; **, $p<0.01$;
694 ***, $p<0.001$ (two-tailed Student's t-test).

695

696 **Supplemental Materials**

697 Supplemental Fig. 1-6

698 Supplemental Movie 1: SARS-CoV-2-infected *Ubxn3b*^{+/+} mice on day 2 after infection.
699
700 Supplemental Movie 2: SARS-CoV-2-infected *Ubxn3b*^{-/-} mice on day 2 after infection.
